REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTIONS

November 1951, Chicago WB Airport, Table 2, total snowfall should be 14.3.

Chicago WB Airport, Table 7, snowfall for 7th day should be 1.3.

La Salle, Table 2, lowest temperature should be 10 on the 5th.

December 1951, Morrison, Table 5, minimum for 15th should be -9, and for the 22nd -29.

Hourly precipitation data from recorder substations are not available.

CLIMATOLOGICAL DATA

ILLINOIS

JULY 1952
Volume LVII No. 7

KANSAS CITY: 1952

ILLINOIS - JULY 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The average temperature for July 1952 was 78.1°, which is 1.7° above normal, thus continuing the above-normal temperature pattern established in June. Deviation from normal varied little within the State. Localities in the northern third reported temperatures averaging 1.9° above normal, in the central third 1.5° above normal, and in the southern third 1.8° above normal. The highest mean temperature was 82.8° at Cairo, and the least mean temperature was 74.2° at Aurora College. With the exception of a brief period around the 10th of July, temperatures during the first half of the month were mostly above normal. Day-to-day variations were more pronounced during the second half of July, and there were no prolonged periods of extreme temperatures. In central and southern counties, the highest readings of the month occurred in most instances on either the 26th or 27th. Maxima at a majority of points in the northern third of the State reached their highest levels on the 2d. The highest temperature observed during the month was 109° at Harrisburg on the 27th. The lowest minimum temperature value in Illinois during July was 47° at Aurora College and Freeport on the 31st.

Precipitation during July averaged 3.44 inches, which is 0.21 inch above normal. However, its distribution was extremely spotty; points in the northern third reported falls which averaged 0.92 inch above normal, those in the southern third falls which were 0.46 inch above normal, while central communities received rainfall which was 0.42 inch below normal. The greatest monthly total rainfall was measured at Rockford, where the accumulated amount was 15.54 inches. The least monthly total was 0.58 inch at Roberts. Rainfall occurred rather generally over the State on the 2d and 3d, the 7th and 8th, and the 28th and 29th. During the period from July 13 through July 19, sporadic shower activity occurred daily, and it was during this period that a series of heavy thunderstorms resulted in a 24-hour fall of 8.41 inches at Rockford.

The month was generally regarded as favorable for crops, although a moisture deficiency was beginning to take effect at scattered points in southern and central Illinois. Both corn and soybeans were further advanced than at the same time during the preceding season.

The heavy thunderstorms previously cited in the Rockford area occurred during July 17, 18, and 19. So heavy was the rainfall that flash flooding resulted, causing 2 deaths by drowning. Damage to property was estimated around $800,000 and to crops around $100,000. A tornado was reported from the Seaton area on the 19th, but damage was slight.--JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

W.R.P.C., Kansas City, Mo. -- 9-5-52 -- 1050

Hourly precipitation data from recorder substations are not available.

CLIMATOLOGICAL DATA

ILLINOIS

AUGUST 1952
Volume LVII No. 8

KANSAS CITY: 1952

ILLINOIS - AUGUST 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

August temperatures averaged slightly below normal in nearly all sections of the State, but rainfall totals varied widely. Almost all stations in the southern three-fifths of Illinois reported light precipitation, in many cases more than two inches under their August normals, while much of the remainder of the State received more rainfall than usual for August. Precipitation totals at individual stations ranged from a maximum of 8.38 inches at Avon to only 0.76 inch at Palestine. Temperatures averaged 73.7°, or 0.9° below normal, varying from 79.8° at Elizabethtown to 69.0° at Freeport. Elizabethtown also had the highest daily temperatures of the month--100° on the 17th and again on the 20th. At Stockton a temperature of 43°, the lowest recorded this August, occurred on the 23d. Only a few instances of localized storm damage were reported during the month.

The first general showers of the month fell on the 3d and 4th, many localities receiving over an inch of rainfall on those dates. The southern half of the State had showers on the 6th, and more general rains fell on the 8th and 9th, with the principal amounts in the north. Most areas benefited from rain on the 11-12th; many southern stations registered the bulk of their August rainfall on those dates. At Cairo 7.29 inches of rain fell during a thunderstorm on the night of the 11-12th, and that station received a 24-hour total of 7.56 inches to set a new local record. Rain covered much of the State between the 14th and 16th and again on the 20-21st, but precipitation amounts of consequence occurred mainly in the northern half. The last ten days of the month were rather dry, with scattered showers about the 26-27th and again on the 30th and 31st, but few localities received beneficial amounts during those periods. Two general warm spells occurred during August, one of several days' duration during the middle of the month, and a more pronounced one which covered the last 6 days of August. Most stations registered their monthly maxima during the latter period. The lowest temperatures occurred between the 23d and 25th, when nearly all stations reported readings in the upper forties or lower fifties.

Dry weather during the month was unfavorable to corn in many central and southern areas, but, on the whole, corn prospects were good except in the southeastern counties. In that area pastures and late hay crops were very short because of dry conditions, resulting in much of the soybean crop being cut for hay. Dry soil also delayed plowing for winter wheat in the southeast. The soybean crop in general was progressing favorably, and both corn and soybeans were farther advanced than at the corresponding time last year. The southern Illinois peach crop was harvested during the month; peaches were small but of good quality.

During a thunderstorm on the night of the 11th, lightning struck the high school at Thebes, and the resulting fire destroyed the building, the loss being estimated at $200,000. On the 20th an evening thunderstorm caused considerable damage in the Peoria-Chillicothe area. A barn was destroyed, two homes damaged, and a man injured by lightning. The storm also shorted power lines. Losses were estimated at $30,000.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Hourly precipitation data from recorder substations are not available.

KANSAS CITY: 1952

ILLINOIS - SEPTEMBER 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Dry weather of the latter part of August continued throughout September 1952, with the result that the lack of precipitation was the outstanding feature of the month's weather. Temperatures averaging 66.8° during September were close to the seasonal normal of 67.7°. Rather low readings prevailed about the first third of the month, with minima in the middle and lower 40's on the 3d and 4th being unusually cold for so early in the season. A rising trend in the middle third of the month more than offset the earlier negative departures, and maxima in the low 90's were general on the 10th, 11th, 12th, and 13th. Moderate cooling occurred after the second third of the month, with temperatures dropping to the upper 30's and lower 40's by the morning of the 23d. Another minor drop occurred by the morning of the 27th, but near-normal readings prevailed the last three days of the month. The highest temperature registered during September was 100° at Palestine on the 1st, while the lowest was 30° at Aurora College on the 23rd. On a divisional basis the maximum departure from monthly normal occurred in approximately the southern third of the State, the departure for that section being 1.7° below normal. The northern third showed the smallest departure from normal, averaging only 0.3° below.

Precipitation over the State showed monthly totals averaging 1.95 inches. This total is the lowest since the record-breaking dry September of 1940, when only 0.65 inch fell. However, the September 1952 precipitation average was not unusually low, as nine other Septembers since 1890 have been drier. Distribution of precipitation through the month consisted of rather general rains of moderate intensity on the 1st and 2d. The next period of general rains was from the 14th to the 22d; however, during this period the precipitation consisted of widely scattered and mostly light showers, occurring at intervals of 1 to 3 days. Northern sections received a scattering of light rains on the 6th and 7th, but none of these rains spread to central or southern sections. Heavy local thundershowers brought a monthly total of 5.44 inches to Warsaw for the greatest monthly total in the State; but totals of near this magnitude were the exception rather than the rule, as the monthly departure for the State as a whole was 1.69 inches below normal. Three stations--Hardin, LeRoy, and Marengo--shared the distinction of having the least September rainfall, only 0.47 inch at each of these stations. Monthly rainfall departures were least in the southern third of the State, where the division average was 0.53 below normal. The northern third of the State showed the greatest precipitation departure from normal with a negative 2.61 inches.

During September Illinois crops matured rapidly. By the end of the first decade more than two-fifths of the corn crop had matured. At the close of the month less than 5 percent of the corn crop was susceptible to frost damage, and harvest of soybeans was well under way. Indications were that the earliest harvest of record would probably occur this year. No important or widespread storm damage occurred in the State during the month.--PFS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+ Also on a later date or dates.
* Amount included in following measurement, time distribution unknown.
Gage is equipped with a windshield.
B Adjusted to a full month.
E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R Daily values and monthly total from recording gage.
T Trace, an amount too small to measure.
V Includes total for previous month.
SS This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Hourly precipitation data from recorder substations are not available.

See note concerning "Hourly Precipitation Data" on page 114 of this issue.

KANSAS CITY: 1952

ILLINOIS - OCTOBER 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Illinois weather during October 1952 was in the main dry and cold. The State-wide average temperature of 50.7° is the lowest for the month since 1925, and it is the fourth coldest October in the Illinois records extending back to 1890. Average total precipitation over the State was only 0.68 inch, which is 1.99 inches below the normal. The October 1952 average precipitation is the third driest in the entire Illinois record, and no October since that of 1908 has been drier.

Distribution of rainfall throughout the State was quite uniform with respect to the normal, the variation in departures being only 0.06 inch. The preceding two months, August and September 1952, also showed negative precipitation departures, with the total deviation for the months of August, September, and October being 4.07 inches below the normal expected in the State during the period. The station reporting the greatest monthly total was Chester, where 1.82 inches fell; while the least monthly total was reported at both Galena and Rochelle, where no rain was observed during the entire month. The season's first appreciable snow fell in the Chicago area on the 20th. Three inches of snow fell there on that date; however, this snowfall was not general in any portion of the State, as it fell only in sections relatively close to the shores of Lake Michigan. Distribution of precipitation through the month consisted of widely scattered and very light amounts in most sections on the 1st. Rather general rains were recorded in the southern third of the State on the 5th and 6th, while the next precipitation period was the 13th to the 15th, when light to moderate amounts fell in the northern sections on the first day and in central and southern sections on the second of the 3-day period. No rains of consequence fell during the entire latter half of the month, although a few stations in the northern third reported a Trace now and then during the period.

The State-wide temperature average of 50.7° is 5.2° below the normal. The beginning of the month was quite warm, with Sparta and Carlyle reporting the State's highest of 95° on the 1st. The lowest during October was 11° on the 29th at Aurora College. The State's temperature departure was composed of negative deviations of 5.2 in the northern third, 5.3 in the central, and 5.1 in the southern. Aurora College reported the lowest mean temperature, which was 45.4°; while the highest mean temperature for the month was 55.3° at three stations--Cairo, Elizabethtown, and Sparta.

The dry, sunny weather with low humidities and mild temperatures, which occurred during the greater portion of October, brought crops to maturity rapidly, and harvest operations progressed at a rapid pace. By the second week of the month the soybean harvest was virtually completed; this was the earliest date of record for the completion of this harvest. Moisture content of corn dropped to an unusually low point for the season, and by mid-month nearly three fifths of the State's corn acreage had been picked. At the close of the month 90 percent of the corn had been harvested, compared with only 50 percent on the same date of the previous year. Good yields in all crops were general, and the rapid harvest resulted in a shortage of storage space.

No storms of consequence occurred in the State during October 1952; however, appreciable damage was caused by forest and field fires. Bu the close of the month drought conditions and unusually low humidities had desiccated inflammable materials, and field and forest fires were occurring at many places. It was not practicable to obtain monetary losses due to forest and field fires; however, it is believed the item was appreciable. In addition to the smoke generated by Illinois fires, wind circulation was favorable to carry smoke into the State from adjacent areas to the west, and as a result visibilities for several days were appreciably diminished.--PFS

ANNOUNCEMENT

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS - NOVEMBER 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

November saw the end of the drought which had covered Illinois for the previous three months. Although much of the State--particularly the northern third--was dry during the first half of the month, two periods of heavy rains in the latter half of November gave most localities above-normal precipitation totals. The average precipitation for the State was 2.95 inches, or 0.33 inch above normal, while totals at individual stations varied from 5.80 inches at the Freeport Sewage Plant to 1.65 inches at Roberts 3 N. Temperatures averaged 44.0°, which is 1.8° above the November normal, and monthly means ranged from 49.1° at Elizabethtown to 39.3° at Freeport. The highest reading of the month was 82°, registered at Carlyle on the 2d, and the lowest was 3° above zero at Stockton on the 28th.

The month began with unusually warm weather, temperatures reaching the 70's on the 1st and also in many sections on the 2d. Southern and central counties received light to moderate rainfall on the 2d, and again on the 8-9th, but few northern stations recorded more than a trace on those dates. The middle of the month was very mild, especially on the 16th and 17th, when temperatures averaged 20° to 30° above normal and maxima generally were in the 70's; many stations reported their highest temperatures of the month at this time. Heavy rains which began in some areas on the 16th and continued through the 18th, finally broke the prolonged dry spell. The heaviest precipitation of this period occurred in the north, where many localities had received no rainfall of consequence since September. Rain again covered the State between the 24th and 26th, with beneficial amounts falling in all sections. High winds caused considerable damage over most of the State on the 25-26th. The last few days of November were quite cold, especially on the 28th, when minima under 10° were registered at many stations in the northern half of the State. Snow flurries occurred frequently as the month neared its end, and on the 29th most central and southern localities received their first measurable snowfalls; at Virden 2.5 inches fell, the greatest amount reported during November.

Only 10 percent of the corn crop remained to be harvested as the month began, due to favorable harvesting conditions earlier in the fall, and practically all of the remaining corn was picked during the first half of November. Dry soil conditions, which continued until the rains of the 16-18th, retarded plowing operations. The rains which fell in the latter half of the month also benefited fall seedings and brought topsoil moisture to normal, although the subsoil still remained dry in many areas.

WINDSTORM OF NOVEMBER 25-26

An intense cyclonic system, the center of which moved in a north-northeasterly direction from Oklahoma through Missouri, Iowa, and Wisconsin, caused high winds over the entire State of Illinois on the 25th and 26th. Although most areas received minor damage, a few localities reported no losses from the winds. Trees suffered considerably. There was widespread damage to power and communication lines, roofs, windows, signs, and television antennae. A radio station's tower near Kankakee was toppled by the winds. One man was reported killed by a falling tree in Logan County. A number of persons suffered minor injuries in the storm. No crop losses were reported as the fall harvest had been completed. Property damages in the State were estimated to total $1,200,000.--GRJ

ANNOUNCEMENT

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

DRAINAGE CODE: 1 ILLINOIS 2. KASKASKIA 3. LAKE MICHIGAN 4. MISSISSIPPI 5. OHIO 6. ROCK 7 WABASH

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

DECEMBER 1952
Volume LVII No. 12

See note concerning "Hourly Precipitation Data" on page 138 of this issue.

KANSAS CITY: 1953

ILLINOIS - DECEMBER 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

December was a mild and cloudy month with no great extremes of temperature. Precipitation averaged slightly under normal, with the northern third of Illinois receiving more than usual for December but negative departures being the rule in most central and southern areas. Brookport Dam 52 reported the greatest monthly precipitation with 4.63 inches, and the least amount was 1.02 inches at Edwardsville. Most of the snow occurred during the first half of the month; snowfall averaged 3.5 inches, with the maximum of 9.0 inches being registered at Stockton. December temperatures averaged 34.2°, or 3.0° above normal, and ranged from 41.0° at Cairo to 27.4° at Stockton. The highest reading of the month was 69° at Albion on the 9th, and the minimum of 7° occurred at Stockton on the 27th. No severe storms were reported during this December.

Snow and cold temperatures prevailed over the State as the month began. Snow began falling on the morning of the 1st and continued until the following day, leaving a snow cover of 1 to 6 inches. However, moderating temperatures and rain on the 3d and 4th soon disposed of the snow cover. Temperatures were above normal for a week after the 3d, being especially high between the 7th and 9th. On the latter dates maxima in the 60's were not uncommon, and all stations registered their highest temperatures of the month during that period. Moderate rainfall covered the extreme south on the 9th, and light precipitation--mainly snow flurries--occurred frequently throughout the State between the 10th and 14th. After a few days of subnormal readings, temperatures moderated at the middle of the month and generally remained above normal for the rest of December, except for a few days of the final week. A wet period of several days' duration began on the night of the 18th, with moderately heavy rainfall on the 19-20th and moderate rainfall again on the 22-23d. No precipitation of consequence occurred during the last several days of the month except for some rain near the Ohio River on the 30th-31st. Many stations registered their minima for December on the 27th or 28th during a short-lived cold spell.

As the fall harvest was completed unusually early this year, only fall-sown grains were in the fields this month. December's precipitation benefited these grains and also helped to replenish subsoil moisture, which had been depleted by the dry fall weather.--GRJ

ANNOUNCEMENT

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

This issue contains additional precipitation data for the storm of August 11-12 on page 142.

CORRECTIONS

Belleville Scott AF Base, Table 2, add temperature departures as follows: Jan. 4.8, Feb. 6.5, Mar. -1.7, Apr. 0.4, May 0.8, June 8.5, July 1.5, Aug. -0.6, and Sept. -0.9.

Mattoon, Table 2, add temperature departures as follows: Jan. 4.6, Feb. 6.4, Mar. -1.3, Apr, 1.8, May 0.3, June 6.9, July 1.6, Aug. -0.6, and Sept. -0.7.

April 1952, Carbondale Sewage Plant, Table 6, total evaporation should be 4.55B.

Springfield WB Airport, Table 6, total evaporation should be 6.89B.

September 1952, Aurora College, Table 2, average minimum temperature should be 48.1, average temperature 62.5, departure -1.4, lowest 35 on 20+, and degree days 129.

Aurora College, Table 5, minimum temperature on 18th should be 58, 23rd 35, 26th 48, and mean minimum 48.1.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ANNUAL SUMMARY 1952

Volume LVII No. 13

KANSAS CITY: 1953

ILLINOIS - 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The year 1952 in Illinois was warmer and drier than normal. All of the winter months as well as June and July were considerably above normal in temperature; only March and October showed significant negative departures. The highest temperature registered in the State during 1952 was 109° at Harrisburg on July 27, and the year's lowest reading was 15° below zero at Stockton on January 24. Most of the deficiency in precipitation resulted from a prolonged dry spell which began late in the summer and lasted until November. The dry, sunny fall weather was favorable for harvesting operations, but many wells went dry and fall plowing was hampered by the lack of soil moisture.

WEATHER BY MONTHS

JANUARY -- Mild and rather dry weather was the rule, the south having the more pronounced departures from normal temperature and precipitation. The greatest temperature variations took place during the latter half of the month, readings ranging from 77° at Greenville on the 17th to 15° below zero at Stockton on the 24th. Although precipitation occurred rather frequently during January, consequential amounts were confined mainly to the first few days, the 14th, and between the 19th and 26th. Snowfall totals varied from 12 inches at Stockton to only a trace at several southern stations.

FEBRUARY -- The mild weather of the preceding month continued to prevail, resulting in the warmest February since 1938. This also was one of the few February's in which no below-zero temperatures were registered, the lowest reading being 8°. Precipitation was light in the north but somewhat above normal in the south. Rain occurred frequently during the first six days of the month, and there was general precipitation also on the 13-14th, between the 19th and 23d, and on the 29th. Chenoa, with 10 inches, reported the heaviest total snowfall.

MARCH -- In contrast to January and February this month was rather cold and wet, the heaviest precipitation falling in the southern division. The first five days were quite cold, and Freeport registered -10° during this period. Mild periods generally were of short duration, although temperatures in the 70's were not uncommon in southern and central areas during the last three days. Precipitation was distributed in fairly even fashion during March, the heaviest amounts occurring in the south on the 10th. Snowfall totals were substantial at many northern localities, the greatest reported being 19.5 inches at Marengo. Tornadoes struck at Kane and Evansville on the 18th, causing $25,000 and $50,000 property damage, respectively; no fatalities occurred in these storms.

APRIL -- This month was rather cool during the first half, but mild temperatures prevailed thereafter. Northern stations had above-normal temperature averages, but the south was slightly cooler than usual for April. Rainfall was most plentiful in the central division, and somewhat below normal in most of the remainder of the State. Nearly all stations registered their last freezing temperatures of the season on or before the 16th. Afternoon temperatures reached the 90's in several localities at the end of the month, the highest reading being 93° at Lacon on the 29th.

MAY -- This was a near-normal month in respect to temperature, but rainfall amounts varied from slightly under average for May in the north and central to nearly 1 1/2 inches below normal in the southern third of the State. High temperatures continued from late April through the 6th of this month, with a maximum of 97° on the 5th at Quincy. Cooler weather prevailed after the 6th, and the majority of stations recorded their lowest readings of the month on the 11th, with 31° occurring at Aurora on that date. There were frequent showers after the first few days of May although daily precipitation amounts often were light. Wind and hail caused an estimated $75,000 damage in the Gladstone area on the 14th. A tornado demolished 14 aircraft at Scott Air Force Base on the 24th.

JUNE -- High temperatures featured the month's weather, this being the second warmest June since State records began in 1890. Many stations passed the 100° mark near the end of June, and East Saint Louis registered 108° on the 29th to equal the State record for the month. For the third successive month rainfall was deficient in the southern third of Illinois, but most northern and central areas received above-normal amounts, mainly through thundershowers. Wind and hail accompanying thunderstorms caused property and crop damage approaching a half million dollars during June. Seven persons lost their lives from lightning strikes or contingent accidents in northern Illinois on the 8th. Crops developed well during the month.

JULY -- The above-normal temperature pattern established in June continued through this month, although the departure from normal was less pronounced. The highest readings in most of the State occurred on the 26th and 27th; Harrisburg reported a maximum of 109° on the 27th for the highest of the month. Precipitation averaged above normal except in the central division, but distribution was spotty. Thunderstorms caused an 8.41 inch downpour at Rockford on the 18th, and that station received a total of 15.54 inches of rain during the month. The heavy rains in the Rockford area on the 18th caused flash floods which took two lives and resulted in damage to property and crops totaling $900,000. The July weather generally was favorable to crops, although a moisture deficiency developed at scattered central and southern localities.

AUGUST -- This month was a little cooler than normal throughout the State. Precipitation showed considerable variation, ranging from moderately heavy at some northern stations to considerably below normal in the southern three-fifths of Illinois. A heavy thundershower at Cairo on the night of the 11-12th gave that city a record 24-hour rainfall of 7.56 inches. Temperatures were highest around the middle of the month and again during the last week; Elizabethtown registered the maximum, 100°, on the 17th and again on the 20th. Dry weather was unfavorable to crops in many central and southern areas, but prospects were good generally except in the southeastern counties. Dry soil conditions also hampered plowing for winter wheat. No severe storms were reported, but lightning destroyed the high school at Thebes on the 11th and caused some property damage in the Peoria-Chillicothe area on the 20th.

SEPTEMBER -- Dry weather prevailed most of the month, particularly in the northern counties. Precipitation averaged 1.95 inches, the least September amount since 1940. Temperatures over the month averaged slightly under normal, with the cooler weather occurring early in the month and again in the last ten days. Maxima generally reached the 90's between the 10th and 13th. September's highest reading was 100°, registered at Palestine on the 1st, and the minimum was 30° at Aurora on the 23d. Crops matured rapidly during the month. Nearly all of the corn crop was safe from frost, and the soybean harvest was well under way at the end of September.

OCTOBER -- Unusually dry, sunny, and cold conditions were the outstanding features of the month's weather. Precipitation averaged only 0.68 inch, which is the smallest October amount since 1908, and the mean temperature of 50.7° was the lowest figure since 1925. What rainfall the State did receive practically all occurred during the first half of October, and some northern stations received no measurable precipitation during the entire month. Three inches of snow fell in the Chicago area on the 20th but most of the State had no snow. The highest temperature of the month was 95° at Carlyle and Sparta on the 1st, and the lowest was 11° at Aurora on the 29th. Favorable maturing weather allowed the soybean harvest to be completed by the second week of the month and the corn harvest to be 90% finished at the end of October. The very dry conditions resulted in many field and forest fires; smoke from fires in Illinois and in states to the west cut visibility appreciably on several days.

NOVEMBER -- The drought which had affected Illinois for the past three months was broken in the latter half of November by two periods of heavy rains, many northern localities receiving their first precipitation of any consequence since September. Temperatures were above normal most of the month but the last few days were quite cold; minima under 10° were common in the northern half on the 28th. Stockton registered 3° above zero on that date for the lowest reading of the month; Carlyle had the highest for November with 82° on the 2d. Snow flurries occurred frequently near the end of the month and most central and southern localities received their first measurable snowfalls on the 29th. High winds caused damage to trees, utility lines, roofs, and other property in most sections of Illinois on the 25th-26th. The remainder of the corn crop was harvested during the first half of November.

DECEMBER -- This was a mild and cloudy month with near-normal precipitation. Temperatures generally were above normal except for short periods at the beginning and near the middle and the end of the month. No subzero temperatures were registered, the lowest reading being 7° at Stockton on the 27th. Many stations had maxima in the 60's between the 7th and 9th, with 69°, the highest reading of the month, occurring at Albion on the 9th. Most of December's snow fell on the first two days of the month when one to six inches of snow covered most of Illinois. December's precipitation benefited fall-sown grains. It also helped to replenish subsoil moisture which had been depleted by the dry fall weather.--GRJ

RELOCATIONS OR CHANGES IN EXPOSURE OF INSTRUMENTS

STATIONS PUBLISHED IN CLIMATOLOGICAL DATA BULLETIN:

Carmi: Rain gage moved 0.7 mile west on December 19.

Chandlerville: Rain gage moved 0.3 mile northeast on September 23.

Flora: Equipment moved 0.6 mile southeast on March 19.

Greenup: Rain gage moved 0.7 mile east on March 7.

Jerseyville: Equipment moved 2.0 miles northwest on October 1.

Kewanee: Equipment moved 2.8 miles south on November 1.

Lacon: Equipment moved 0.2 mile south-southeast on March 12.

La Harpe: Equipment moved 1 mile north on July 16.

Mackinaw: Rain gage moved 0.3 mile north on July 2.

Nashville 3 NW: Rain gage moved 100 feet northwest on April 22.

Pleasant Hill: Rain gage moved 1.4 mile southwest on March 25.

STATIONS PUBLISHED IN HOURLY PRECIPITATION DATA BULLETIN:

Edelstein: Recording gage moved 0.2 mile east on June 11.

Farmer City: Recording gage moved 0.6 mile northwest on March 11.

Louisville: Recording gage moved 0.3 mile north on March 17.

Maroa: Recording gage moved 0.4 mile east on September 15. Moved 120 feet west on December 8.

Mason City: Recording gage moved 0.3 mile northeast on March 15.

Washington: Recording gage moved 0.3 mile northeast on November 5.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.

-	No record.
+	Also later date (dates) or months.
*	Amount included in following measurement.
//	Gage is equipped with a windshield.
B	Adjusted to full month.
E	Amount is wholly or partially estimated.
M	Less than a complete month of record available; if average value is entered, less than 10 days of record are missing; see monthly Climatological Data for detailed daily record.
R	Data from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 4-20-53 -- 1205

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

CLIMATOLOGICAL DATA

ILLINOIS

JANUARY 1953
Volume LVIII No. 1

KANSAS CITY: 1953

ILLINOIS - JANUARY 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

January's weather followed the pattern of the preceding month with mild temperatures and cloudy skies predominating. Precipitation averaged somewhat below normal in all sections despite the prevailing cloudiness and fairly frequent periods of rain or snow. Brookport had the heaviest precipitation of the month--5.33 inches--and Galena registered the least amount--0.57 inch, while snowfall ranged from 16.1 inches at Rock Island to only a trace at a few southern stations. Subzero temperatures were confined practically to the northern division, the lowest reading of the month being 12° below zero at Kankakee 4 NW on the 6th. Carbondale and Elizabethtown each recorded the highest temperature during January--69° on the 26th. Mean monthly temperatures at individual stations varied from a maximum of 41.1° at Cairo and Elizabethtown to 23.1° at Stockton. No severe storms were reported during January.

Temperatures were well above normal as the month began, but the coldest weather of the month soon followed. Except in the southern division, most stations registered their minima for January on the 6th or 7th, when temperatures dipped below zero over most of the northern third. Precipitation, often in the form of snow, occurred frequently between the 2d and 10th, although amounts were light on several days of this period. Most southern and central localities received nearly all of their January snowfall in the first week. Temperatures moderated about the 8th and reached levels much above normal between the 13th and 15th; on the latter date maxima of 60° or higher were common in the southern and central portions, and most stations registered their highest temperatures of the month. However a cold front swept across Illinois on the afternoon of the 15th, dropping temperatures sharply, so that minima on the morning of the 16th were far below the freezing point. Another period of general precipitation began on the 14th and lasted through the 17th, considerable snow falling at many northern localities on the latter date. Rain or snow also occurred generally on the 19th-20th, the 22d-25th, and light precipitation fell in most sections during the last few days of the month. Mild weather prevailed nearly all of the latter half of January, but temperatures dropped to around the zero mark in the extreme north on the 29th. Freezing rain or drizzle occurred on several days during the month, being most common between the 7th and 10th and on the 17th, resulting in hazardous driving conditions.--GRJ

NEW STATIONS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

FEBRUARY 1953
Volume LVIII No. 2

KANSAS CITY: 1953

ILLINOIS - FEBRUARY 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

February's weather was similar to that of December and January, with generally mild temperatures and precipitation below normal over most of the State. Excepting February 1952, this month was warmer than any February in the past 15 years. The State average temperature was 36.1°, or 6.2° above normal, and individual station averages varied from 43.7° at Elizabethtown to 27.2° at Stockton. Precipitation totaled above normal only in the northern division, but even many northern stations received deficient amounts. Over the State, precipitation averaged 1.53 inches, compared to the February normal of 1.92 inches, and station totals ranged from 0.52 inch at Rushville to 3.08 inches at Monmouth. Snowfall was well under normal, averaging only 1.2 inches. The south and much of the central division received no measurable amounts of snow during the month; Utica reported the greatest total snowfall for February with 7.0 inches. In contrast to the persistent cloudiness of the preceding 2 months, Illinois received considerable sunshine in February. No severe storms were reported during the month.

Except for a few short-lived cold spells, temperatures were above normal throughout the month. Most southern localities recorded their maxima for February on the 2d, when 66°, the high for the month, was registered at Sparta. In the central and northern divisions the monthly maxima usually occurred on the 18th or 20th, when afternoon temperatures were in the high 50's and lower 60's. Most localities had their coldest weather on the 17th, below-zero minima being general in the north on that date. The lowest temperature for February, 12° below zero, occurred on the 17th at Aurora. The first precipitation of consequence, mainly in the form of rain, fell on the 5th and 6th, and the next general rainfall came on the 10th and 11th. The only snowfall of any significance covered most of the north and a few north-central areas to a depth of a few inches on the 15th and 16th. The heaviest rainfall of the month occurred on the 19th-20th, many stations receiving over an inch of rain in that period. Little precipitation fell during the last week of the month.

Fall-sown grains generally came through the winter in good condition, and very little damage to fruit trees was reported.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement; time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly [illegible] from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price [illegible] year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

MARCH 1953
Volume LVIII No. 3

KANSAS CITY: 1953

ILLINOIS - MARCH 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Temperatures and precipitation both averaged above normal during March 1953, this being the warmest March since 1946 and the wettest since 1948. The mean temperature for the State was 42.7°, individual station averages ranging from 34.6° at Stockton to 52.5° at Cairo. Precipitation over Illinois averaged 4.61 inches, with the greatest total reported being 7.77 inches at Cairo and the least amount 1.76 inches at Freeport. The mean snowfall for March was 5.2 inches, the heaviest total of 12.4 inches occurring at Marshall. A few extreme southern stations reported no snowfall during the month.

March was ushered in with cold and snowy weather. Much of central and southern Illinois received several inches of snow on the 1st, and snow occurred frequently in the north during the remainder of the first week of the month, while moderate to heavy rains were received in the south. The lowest temperatures during March were registered between the 4th and the 10th, the minimum for the month being 2° above zero at both Morris 3 NE and Watseka on the 9th. Temperatures moderated after the 10th and generally remained well above normal for the next two weeks. The highest reading of the month--80°--was registered at East Saint Louis on the 21st, while other stations throughout the State reached the 70's. After the 23d, temperatures dropped and remained below normal during most of the last week of March. Rain occurred frequently during the last three weeks of the month, the more important amounts falling on the 12th, 14th, 18th, 21-23d, and 30-31st.

At the end of March oat seeding and spring plowing were farther advanced than usual. Winter wheat was in above-average condition in all areas. Peach orchards in the extreme south bloomed during the latter part of the month. March rainfall brought soil moisture to normal in all sections of the State.

On the evening of the 14th a tornado formed six miles southwest of Nashville and moved northeastward through rural areas in Washington, Jefferson, and Marion Counties. One home was destroyed, several damaged, and a large number of other structures were damaged; total losses were estimated at $75,000. On the afternoon of the 14th, hail occurred in several central Illinois counties, damaging greenhouses, roofs, windows, and automobiles in Scott, Greene, Morgan, and Sangamon Counties. Hailstones over an inch in diameter fell in many localities. Losses in the hailstorm were estimated at $250,000, with the heaviest damage occurring in the Manchester and Roodhouse areas. A windstorm caused an estimated $7,000 loss in the Charleston area on the evening of the 22d.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

APRIL 1953
Volume LVIII No. 4

KANSAS CITY: 1953

ILLINOIS - APRIL 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

During April 1953 both temperatures and precipitation averaged below normal in Illinois. The departures in the preceding month were also negative for both precipitation and temperature; the deficiency in precipitation furthermore prevailed in January and February. The average temperature during April was 49.3°, which is 3.2° below the normal. Highest temperature recorded during the month was 88° on the 9th; this maximum occurred at Alton Dam, DuQuoin, and East Saint Louis. The lowest temperature during the month was 20°, recorded at Aurora College on the 19th. The temperature departure was rather uniform over the State, being 3.0° below over the northern and southern thirds and 3.4° below over the central third. During April 1952 both temperatures and precipitation averaged slightly above normal.

Total rainfall from all stations in the State averaged 2.92 inches for the month; this value is 0.63 inch below the normal. Unlike the temperature departures, precipitation showed considerable variation in different parts of the State. Shawneetown had the greatest monthly amount with 5.25 inches, while the station with the least monthly amount was Rockport, where only 1.17 inches fell during the entire month. On a sectional basis, the total monthly fall averaged 2.58 inches over the northern third of the State, which is 0.45 below normal. The average in the central division was 2.42 inches, or a deficiency of 1.21; while in the southern third the monthly fall averaged 4.34 inches, which total is 0.23 inch above the normally expected amount. Nearly all stations in the southern third of the State had more than 4.00 inches of rainfall, and minor flooding occurred at some local points there. What is normally the last snowfall fell in the State during the month. The snowfall was a bit unusual in that it was confined mainly to the west-central part of the State, where 5.0 inches fell at four different stations on the 17th. These stations were Golden, Griggsville, Quincy, and Quincy Memorial Bridge. The snow was quite wet; much of it melted as it fell, and none stayed on the ground very long.

The 1953 growing season opened in Illinois with oat seeding and spring plowing more advanced than usual and with winter wheat, apples, and peached in good condition. Field work was delayed by rain in the second week of the month, but by the end of the third week, 95 per cent of the oat acreage had been sown and about 66 per cent of the plowing for corn and soybeans had been completed. By the close of the month, the oat seeding was virtually completed, and some corn was in the ground in extreme southern counties. However, insects were becoming a problem in clover and alfalfa fields.

During April 1953 two tornadoes occurred in the State. Both happened on the afternoon of April 9, one in Logan County and the other in Champaign and Vermilion Counties. The Logan County tornado did but little damage, but the damage in Champaign and Vermilion Counties was between four and five million dollars and a number of persons were injured.--PFS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3. 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

MAY 1953
Volume LVIII No. 5

KANSAS CITY: 1953

ILLINOIS - MAY 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The average temperature for May 1953 was 64.0°, or 1.3° above normal for the month. All three divisions showed positive temperature departures, ranging from +0.9° in the north to +1.9° in the south. Despite the temperature averages, much of the month was rather cool, but several hot days during the last week of May served to boost the monthly figures above normal. Southern stations reported their highest readings of the month on the 26th when 101° was registered at East Saint Louis. Practically all of Illinois had temperatures in the 90's again during the last three days of May, and most northern stations recorded their highest May temperatures on the 30th. The coldest days of the month were the 3d, 4th, 13th, and 14th; and the lowest temperature reported during May was 30°, which occurred at Stockton on the 13th. Monthly temperature averages at individual stations ranged from 58.1° at Waukegan to 70.2° at Cairo.

Rainfall during May was deficient throughout the State except at scattered localities, mainly in the southeast. The precipitation average for the month was 3.02 inches, which is 1.11 inches below normal. The greatest deficiency in precipitation occurred in the central division, which averaged 1.39 inches below normal, while the southern third of the State received the most rainfall and averaged only 0.44 inch under its May normal. Wayne City reported a precipitation total of 5.62 inches, highest for the month, while the least amount was 1.33 inches at the Springfield Airport Station. Rain occurred frequently during the first week of May, although daily amounts usually were light. Showers were general also on the 12-14th and 16-17th, with many stations reporting over an inch of rain during the latter period. The last showers of any consequence occurred between the 21st and 24th, when much of Illinois received substantial precipitation.

Weather conditions during May were favorable on the whole for corn and soybean planting, although rains had delayed field operations in some southeastern and extreme southern areas. Over much of central Illinois soil moisture was somewhat deficient at the end of the month, but crops had not suffered materially. The red clover crop was considerably damaged by insects, especially in the central area.

A severe storm of wind and hail struck northern Iroquois County on the morning of the 22d, causing an estimated $1,000,000 damage to an area 30 miles long and 10 to 15 miles wide. A large number of homes and other buildings were damaged, and crops were ruined in many fields. In some parts of the storm area, hail fell to a depth of more than three inches. Thirty-one persons were reported injured, a few of them seriously, by the storm. Also on the 22d a thunderstorm caused considerable minor damage in the Rock Island-Moline area. Four persons were drowned in the Mississippi near Galena on the 10th after high winds upset their boat. Two tornado funnels formed aloft at Palestine on the 7th, but did not reach the surface and no damage resulted.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 7-10-53 -- 955

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

JUNE 1953
Volume LVIII No. 6

KANSAS CITY: 1953

ILLINOIS - JUNE 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The outstanding feature of this month's weather was the unusually high temperatures which prevailed during most of June. Only three times in 64 years of State-wide records have June temperatures exceeded the 77.1° average (5.0° above normal) of this month. The highest temperature this June--108° registered at Palestine on the 20th--tied the record for the month. Rainfall was deficient in most sections of the State, averaging 3.42 inches, or 0.60 inch below normal. A number of northeastern and east-central stations received above-normal precipitation, but, except for scattered localities, the remainder of Illinois was rather dry.

Temperatures were slightly below normal during the first two days of June, but by the afternoon of the 4th maximum readings were in the 90's over the entire State. Cooler weather followed on the 6th and 7th, only to be succeeded by above-normal temperatures which continued almost uninterrupted over most of the State during the balance of the month. The hottest weather during June generally occurred between the 8th and 12th, the 19th-20th, and on the last two days of the month. With the exception of a few stations in the extreme south, temperatures were highest on the 19th and 20th, hitting 100° or higher on one or both days in almost all southern and central localities and also over much of the north. The lowest temperature registered during June was 40°, occurring at Freeport on the 2d. Mean monthly temperatures varied from 83.2° at Cairo to 70.1° at two Lake County stations, Antioch and Waukegan.

A dry spell which had covered the State during the last week of May, continued for the first few days of June. Showers fell in the north on the night of the 4th and spread over most of Illinois by the 6th, the more beneficial amounts generally occurring in the northern half. Showers were common in northern and central Illinois on the 8th-9th, and heavy thunderstorms occurred at some extreme northern localities in the early morning hours of the 10th. Scattered showers were reported on the 11th, and most of Illinois received generous precipitation amounts on the 13th-14th. A few showers, mainly light, occurred on the 15th, but during the next nine days no rain of consequence was reported except for scattered thundershowers, mainly in the southwest portion, on the 23d. Thundershowers on the 25th-26th, which were heavy in many central and southern localities, broke the dry spell over much of Illinois. General showers of moderate intensity also occurred on the 27th-28th. Although the southern division was the driest part of the State during June, a southern station, Grand Tower 2 N, received the heaviest total rainfall--7.31 inches. Another southern station, Elizabethtown, reported the least rainfall with 1.14 inches.

The generally hot, dry weather during June hastened the maturity of winter wheat, and over half of the crop was harvested by the end of the month. Corn varied widely in height but averaged two feet as the month ended. Soybean stands were normal in the northern half but below average in the south, due to the shortage of moisture. Heat and lack of moisture also caused pasture conditions to be under normal in many areas.

SEVERE STORMS

In several counties along the Wisconsin border and also in Cook County, thunderstorms on the night of the 4th-5th brought high winds and heavy rains, causing an estimated $50,000 property damage. On the afternoon of the 5th winds destroyed a theater in Lake County, and wind and lightning also caused damage in Cook and McHenry Counties; two persons were injured and property damage was estimated at $250,000. Also on the 5th at Canton wind downed many trees, killing one man and damaging several homes and cars; and at Spring Valley lightning set fire to a large garage which was destroyed. High winds in the Joliet-Lockport area on the 8th badly damaged two buildings at the State Penitentiary. In the Chicago area on the 10th, heavy thundershowers caused some flooding, and lightning started several fires. The most extensive storm of the month occurred on the 13th; a line of thundersqualls, first reported in Whiteside County about 7:00 a.m., moved rapidly to the south-southeast, reaching Williamson County early in the afternoon. The storm covered a path approximately 50 miles wide and left a trail of damage, mainly from high winds, nearly the length of the State. Annawan, Geneseo, Peoria, Lincoln, Clinton, Springfield, Carlinville, Vandalia, Salem, Centralia, Mount Vernon, West Frankfort, and Marion were among the communities reporting property damage totaling $500,000; at least five persons were injured. On the 24th at Lincoln high winds downed many trees, injuring one person and damaging a few homes and cars.--GRJ

Peoria WB Airport, Table 5, add minimum temperatures as follows: 18th through 25th should be 24, 25, 31, 30, 32, 31, 24, and 23; 29th 11 and 31st 20.

Quincy, Table 5, minimum on 22nd should be 34.

Quincy CAA AP, Table 5, minimum on 16th should be 6, 17th 20, 18th 23, 19th 24, 20th 28, 21st 27, 23rd 27, 24th 20, 25th 21, 27th 20, 29th 17, 30th 28.

Rockford CAA AP, Table 5, minimum on 20th should be 21 and on 25th 6.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 8-11-53 -- 955

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

ILLINOIS

JULY 1953
Volume LVIII No. 7

KANSAS CITY: 1953

ILLINOIS - JULY 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

This July averaged a little warmer and wetter than normal for the State as a whole. However, although temperature departures showed little variation over Illinois, there were great differences in precipitation totals. Rainfall was deficient in the southern counties and also in the westernmost portion of central Illinois, while most localities in the remainder of the State received generous amounts. Watseka registered the heaviest rainfall, a total of 11.75 inches, while only 0.36 inch fell at Carmi during the month. The average for the State was 3.67 inches, which is 0.44 inch above normal. Illinois temperatures averaged 77.4°, or 1.0° above normal, and station averages varied between Cairo's 82.6° and Freeport's 72.4°.

Hot weather generally prevailed during the first few days of July, followed by cooler temperatures which persisted for nearly two weeks. The lowest temperatures of the month were registered between the 9th and 11th, when minima in the upper 40's occurred in several northern and a few central localities. Freeport's reading of 47° on the 10th was the lowest reported during July. After the 18th, warmer weather prevailed, for the most part, and temperatures were especially high during the last few days of July, when the majority of Illinois stations reported their highest readings of the month. A large number of central and southern localities had maxima of 100° or higher near the end of July, the highest reported being 108° at Alton on the 29th.

During the first week of the month, frequent--and often heavy--rains occurred in northern and much of central Illinois, while the southern division received only a few scattered showers. On the 5th, 4.24 inches fell at Chanute Air Force Base, Rantoul, and many other localities received over two inches of rain in a day early in the month. A spell of generally dry weather followed, being broken by showers which brought substantial rainfall to most areas on the 16th-17th. Beneficial showers again occurred on the 20th-21st, but the rest of the month was rather dry except for some showers, mainly in the north, during the last few days of July.

The wheat harvest began in June and was practically completed by mid-July, and nearly all of the oat crop was combined during the month. Wheat quality and yields were excellent, but the oat crop generally was poor. Corn and soybeans made fine progress during the month, except in some of the drier areas, and prospects were good for those two major crops. Nearly a third of the plowing for winter wheat was completed in July despite delays due to dry-soil conditions in some areas. Pastures deteriorated in the south and west-central portions due to lack of rain.

STORM DAMAGE

A number of damaging local storms were reported during July. On the 1st high winds caused considerable damage in the LaSalle-Peru and Ottawa areas, and hail damaged crops in southern LaSalle County. On the 2d high winds brought down many trees and utility lines in the Rock Island-Moline area, and heavy rains caused some flooding. High winds on the morning of the 5th brought down many tents at a Peoria fair and injured eight persons, one seriously. Much damage occurred at several northern and central communities on the night of the 5th, mainly because of high winds; Moline, Rock Island, LaSalle, Streator, Peoria, Springfield, and Decatur were among the cities suffering wind damage, while considerable flooding also occurred in the Rock Island-Moline area, and heavy hail caused crop and property damage in parts of Mercer and Henry Counties. Also on the 5th, a tornado funnel which did not reach the surface, was observed near Downs in McLean County. Hailstones damaged crops near Hooppole in Henry County on the 20th, and hail and wind caused damage to crops and trees near Sycamore on the 28th. Four deaths due to lightning were reported during the month; one boy was killed and two others injured at Lake Bloomington on the 2d; two children died near Warren on the 5th; and one man was killed at Springfield on the 31st. Lightning also destroyed nine dairy cattle near Morrison on the 20th.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 3-8-53 -- 155

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

CLIMATOLOGICAL DATA

ILLINOIS

AUGUST 1953
Volume LVIII No. 8

KANSAS CITY: 1953

ILLINOIS - AUGUST 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The State-wide average monthly rainfall of only 1.12 inches for August 1953 was the second lowest since records began in 1890. The driest August of record was that of 1893, when the average fall was 0.91 inch. The greatest deficiency of rainfall was in the southern third of the State. Average fall in the northern division was 1.37 inches, a deficiency of 1.97 inches; in the central division the average fall was 1.11, a deficiency of 2.16 inches; but in the southern third the average was 0.79 for a negative departure of 2.76 inches. The largest monthly total was 3.70 inches at Paris, while the least monthly fall was 0.09 inch at Ste. Marie. Practically all of the month's measurable rainfall occurred in the first 16 days. Almost daily showers fell at points in the northern third of the State from the 1st to the 12th, and while the showers were not so persistent in central and southern sections, they did occur rather frequently. From the 17th to the close of the month, unusually dry weather accumulated a near-record departure for the month.

Temperatures during the month were not far from the normal. The State-wide average of 75.5° is 0.9° above normal. The highest temperature reported was 106° at Alton on the 1st, while the lowest was 44° at three stations--Freeport, Kankakee, and Stockton. Cairo had the highest mean temperature for the month with 80.5°, while Freeport with 70.8° had the lowest mean. The warmest day of August was the 31st, when 100-degree temperatures were general. Most stations recorded their lowest readings during a cool snap extending from the 18th through the 20th.

Most important damage during the month resulted from a large number of heavy hailstorms which developed in north-central and northeastern sections of the State on the afternoon and evening of the 7th. These storms occurred in Bureau, LaSalle, Grundy, Will, and Livingston Counties; they stripped and flattened corn and soybeans over wide areas, with an estimated crop loss of $500,000. Severe losses were also sustained by truck gardeners, and property damage was estimated at $50,000. On the same day hail damage to apples and peaches in the Anna-Cobden areas resulted in losses estimated at $150,000. No injuries to persons were reported in connections with the widespread hailstorms.

Illinois crops did well in August 1953, especially during the first three weeks. By the 4th of August 95 percent of Illinois' corn had tasseled, which development was much earlier than usual. On the same date, soybeans were also ahead of normal development, with 80 percent blooming and 55 percent podding. By the 18th about 90 percent of the corn was in the roasting ear stage, and more than 80 percent of the soybeans had started to pod. Hot, dry weather the last two weeks of the month forced maturity of corn and soybeans. At the close of the month, over a fourth of the corn was safe from frost, and over half of the soybeans had begun to turn yellow. Warm, dry weather in the last half of the month reduced prospective yields, especially in late planted fields.

SUPPLEMENTAL DATA

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

ILLINOIS

SEPTEMBER 1953
Volume LVIII No. 9

KANSAS CITY: 1953

ILLINOIS - SEPTEMBER 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Deficient rainfall was the outstanding characteristic of September 1953 weather in Illinois. State-wide rainfall averaged only 1.59 inches, which amount is 2.05 inches below normal. On a divisional basis, the deficiency was 1.38 inches in the northern third of the State, 2.12 inches over the central, and 2.82 in the southern third. Moderate amounts of rain fell at local points throughout the State on the 4th and 19th. Light amounts fell at scattered points between the 6th and 18th, but no point received even moderately heavy amounts during this period. No measurable rain fell over the southern third of the State between the 21st and the end of the month. The total monthly rainfall at Grand Tower was only 0.02 inch for the least in the State, while Rushville's monthly total of 3.92 inches was the greatest. Although rainfall during September 1953 was very light, it did not approach the record. The driest September of record is that of 1940, when the State averaged only 0.65 inch; and there are four other September's which had less rainfall than that of this year. However, dry conditions had developed the latter half of August, and with deficient rainfall continuing through September, sufficient subsoil moisture was not available for rapid growth of crops.

Temperatures during the month averaged 68.8 degrees. This average is 1.1 degree above normal for September. Over the State, temperature averages ranged from 66.0 degrees in the northern third to 69.1 in the central and 72.1 in the southern third. The highest reported in the State during the month was 108 degrees at Flora on the 1st, while the lowest was 31 degrees at Vandalia on the 22d. Record-high temperatures for so late in the season occurred at a number of points at the beginning of the month, when readings in excess of 100 degrees were reported. Unusually high temperatures were again widespread at the close of the month. The season's first killing frost occurred in the extreme northwestern corner of the State on the morning of the 22d. Light scattered frosts occurred over the remainder of the State the same day. However, by the 22d, 95 per cent of the Illinois corn crop was safe from frost, and about one-third of the soybean crop had been harvested, so no appreciable damage resulted from the frost.

The only storm damage of consequence during the month occurred on the evening of the 26th. A number of thunderstorms, accompanied by strong winds and hail, developed around 7:00 p.m. at scattered points in north-central Illinois. Hail damage was not appreciable, but wind damage at points in Schuyler, Fulton, Knox, Peoria, Stark, Marshall, Putnam, and LaSalle Counties, was estimated at two million dollars.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

[illegible]

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

ILLINOIS - OCTOBER 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The most important feature of Illinois weather during October 1953 was the continuation of important negative precipitation departures. The State-wide departure averaged 1.11 inches below normal, with the precipitation averaging 1.56. The magnitude of the October precipitation departure was not extremely large, but --combined with departures in excess of two inches during the preceding two months --tended to accentuate already prevailing dry conditions. On a sectional basis, the southern third of the State received the largest amount of rain, while the northern third received the least amount. The total fall in the southern third was 2.16 inches, which was only 0.87 inch below the normal. In the northern third the total fall was 1.05 inches, or a departure of 1.36 below normal. The central division averaged 1.61 inches, which is 1.06 below the normal. The distribution of monthly rainfall was favorable, because, due to large deficiencies in preceding months, the need for moisture was greatest in the southern third of the State. Of all the reporting stations, Mount Carmel Water Works had the greatest monthly total of 4.09 inches. Least monthly total was 0.31 inch at Galena. No snow was reported from any station during the month. Usually a few stations in the northwestern part of the State receive a little snow during October. Occurrence of precipitation within the month was confined to two periods. These periods were from the 2d to the 6th and from the 26th to 28th. Rain was general over the State during the above dates, but amounts varied, the heaviest falls being in the south and the lightest in the north.

Mild weather prevailed the greater part of the month. Temperatures averaged 59.5° over the State for a positive departure of 3.6°. The highest temperature of the month was 98° on the 2d at Albion and Harrisburg. Lowest was 22° at Sycamore on the 29th. Although the month was mild, it was not near the record-high average temperature of 63.6° set in 1947. Temperatures showed but little variation between northern and southern sections. The average in the northern third was 58.1°, in the central third 59.7°, and in the southern 61.0°. The warmest day of the month throughout the State was the 2d when maxima were generally around 90°. With minima generally in the upper 20's, the 29th and 30th were the coldest days of the month.

No storm damage was reported during October, and since dry weather hastened maturity of all crops, an unusually early harvest was general throughout the State this season. At the close of the month, winter wheat stands were good, but greatly in need of soil moisture.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

ILLINOIS

NOVEMBER 1953
Volume LVIII No. 11

KANSAS CITY: 1954

ILLINOIS - NOVEMBER 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Sunny, dry, and mild conditions continued to prevail most of November, as they had earlier this autumn. This was particularly true of the first 2 1/2 weeks of the month, when clear skies were the rule over most of the State. Precipitation averaged only 0.90 inch in November, or 1.72 inches below normal, making this the fourth consecutive month with a subnormal supply of moisture. Temperatures were above the November normal, particularly in the north, averaging 44.6° and making this the warmest November for Illinois in 5 years. No damaging storms were reported during the month.

Practically no precipitation occurred in the State before the 18th, except for some snow on the 5th in the northeastern quarter. This snowfall was limited to light flurries outside of the Lake Michigan vicinity where measurable amounts were reported. Beneficial rains fell in most sections on the 19th-20th and 22d, and lighter precipitation was common during the last week of the month. Most of the State received some snow near the end of November with amounts of an inch or more falling in northern and east-central localities. The heaviest precipitation during November occurred at Galena, where a total of 1.87 inches fell, and the least amount was 0.35 inch at Golden. The Chicago airport station had the greatest snowfall total--7.6 inches--while a number of southern stations received no snow during the month.

Mild temperatures prevailed during the first 3 days of the month followed by a few rather cold days. A week of unusually warm weather, with maxima mainly in the 70's, began on the 13th, and many stations set new temperature records for so late in the season during this period. After a cold spell between the 25th and 28th temperatures again rose to normal as the month ended. Mean temperatures for November at individual stations ranged from 48.9° for Cairo to 40.7° for Aurora. The highest temperature for the month was 79° at Harrisburg on the 2d, and the lowest was 5° above zero on the 28th at Aurora.

Favorable weather conditions during the fall months allowed the harvest to proceed rapidly during September and October leaving only ten percent of the corn crop and practically none of the soybeans unharvested at the beginning of this month. Fall plowing continued to be hampered by dry soil conditions during most of November. Despite the lack of moisture, stands and color of winter wheat generally were good, although top growth was short. Because of the continuing shortage of precipitation, many wells were dry and the water resources of many localities were dangerously low.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

DECEMBER 1953

Volume LVIII No. 12

KANSAS CITY: 1954

ILLINOIS - DECEMBER 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

December 1953 averaged somewhat warmer and drier than normal, although there was considerable variation in precipitation amounts. The northern third of the State received substantial amounts of moisture, but the south and most of the central portion were rather dry. The State average was 1.74 inches, or 0.41 inch under normal, this being the fifth successive month with a deficient precipitation average. The mean temperature for December was 33.4°, or 2.2° above normal, with the greatest departures in the north. No damaging storms were reported during the month.

Wet weather prevailed during the first part of the month when substantial rainfall covered the State, the greater amounts occurring on the 2d-3d and 5th-6th. On the 9th rain again fell in the central and southern portions, while much of the northern division received several inches of snow. Light rain or snow also was general on the 14th-15th. During the latter half of December the only Statewide precipitation occurred on the 21st-22nd, when most of the northern half of Illinois was blanketed with a moderate to heavy snowfall, while the souther half received light rain. Dry conditions prevailed after the 22d except for some rain in the south on the 28th. The greatest total precipitation reported for December was 3.32 inches at Chenoa, and the least was 0.35 inch at Mt. Olive. Only traces of snow occurred over most of the south and in a few central localities, but in the north total snowfall ranged up to 13.0 inches at Mt. Carroll.

Mild temperatures were the rule during most of the first two weeks of December. All stations registered their maxima for the month between the 3d and the 8th, the top reading for the State being 68° at Harrisburg on the 5th. Colder weather swept into Illinois at the middle of December, and by the 17th temperatures had dropped below zero in the north and in much of the central portion. The lowest reading of the month, 12° below zero, was recorded at Stockton on the 17th. A few mild days followed, but another cold spell moved in on the 22d, with subzero temperatures again common in the north and central portions. Moderate temperatures prevailed during the last week of the month. Mean December temperatures for individual stations ranged from 25.5° at Stockton to 39.3° at Cairo.

Although precipitation continued to be under normal in most of the State, the condition of winter wheat was mainly good. Community water supplies were low in many southern and west-central areas because of the protracted shortage of rainfal

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 2-17-54 -- 975

CORRECTIONS

May 1953: Carbondale Sewage Plant, Table 6, Evap from the 1st through the 31st should be .12, .29, .14, .19, -, .10, .15, .19, .03, .21, .23, .09, .08, .07, .00, .05, .19, .06, .20, .16, .26, .17, .35, .05, .35, .24, .21, .23, .19, .32, .30 respectively, total 5.39B. Wind from the 1st through the 31st should be 25, 65, 15, 8, 29, -, 26, 19, 10, 38, 50, 3, 27, 48, 11, 11, 7, 13, 16, 68, 4, 36, 49, 14, 25, 10, 25, 30, 30, 7, 10, respectively, total 7.53B.

November 1953: Ottawa, Table 7, snow on ground on the 30th should be a dash.

ANNUAL SUMMARY 1953

Volume LVIII No. 13

KANSAS CITY: 1954

ILLINOIS - 1953

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Unusually warm and dry weather prevailed in Illinois during 1953. April was the only month to average colder than normal, while 6 months of the year had mean temperatures more than 2° above normal. The highest Illinois temperature during 1953 was 108°, registered at Palestine on June 20, at Alton on July 29, and at Flora on September 1; the lowest reading was 12° below zero, occurring at Kankakee 4 NW on January 6, at Aurora on February 17, and at Stockton on December 17. The mean precipitation for the year was 27.94 inches, which is 76 percent of the normal amount, and in only 2 months--March and July--did the State average rise above the normal value. The greatest deficiency of precipitation occurred in the south and west-central portions, where many wells went dry and a number of communities were faced with dwindling water supplies. The lack of moisture adversely affected crops in some of the drier areas, although agricultural production on the whole did not suffer greatly.

WEATHER BY MONTHS

JANUARY -- Mild, cloudy conditions prevailed most of the month. Precipitation occurred frequently, but often was light and averaged below normal. Subzero temperatures were practically confined to the northern third of the State. The highest temperature of the month was 69°, occurring at both Carbondale and Elizabethtown on the 26th, while the lowest was -12° at Kankakee 4 NW on the 6th. Central and southern localities received nearly all of their snow during the first week, but the northern division had substantial snowfall during the latter half of the month.

FEBRUARY -- Mild weather continued this month, with temperatures much above normal, and sunshine was more prevalent than in the earlier winter months. Although there were no pronounced dry periods, precipitation continued to average below normal except in most of the northern division. Temperatures ranged from 66° at Sparta on the 2d to -12° at Aurora on the 17th. Snowfall during the month averaged only 1.2 inches, no measurable amounts being reported in the southern half of the State.

MARCH -- This was the wettest month of the year for central and southern Illinois, and the only month in 1953 which averaged above normal in precipitation for all three divisions. Temperatures continued above normal, being especially warm between the 10th and 23d. The high reading for March was 80° at East Saint Louis on the 21st, and the low was 2° at both Morris 3 NE and Watseka on the 9th. Snowfall was practically confined to the first 8 days of the month, but many substantial amounts occurred in that period. The excessive precipitation received this month generally restored soil moisture. On the 14th a tornado caused $75,000 damage in rural areas of Washington, Jefferson, and Marion Counties; also on the 14th a severe hailstorm resulted in $250,000 total damage over several west-central counties.

APRIL -- Rather low temperatures prevailed during much of April, this being the only month of the year averaging colder than normal. Precipitation was deficient in the northern and central divisions, but somewhat above the April normal in the south. All measurable snowfall occurred between the 17th and 19th, with as much as 5 inches falling in some west-central localities. The maximum temperature for the month was 88°, occurring at three southern stations on the 9th, and the minimum of 20° was registered at Aurora on the 20th. Two tornadoes occurred on the 9th, one in Logan County and another in Champaign and Vermilion Counties. The latter storm caused heavy property damage and injured several persons.

MAY -- Much of the month was rather cool, but unseasonably high temperatures during the last week served to boost the average above normal. Precipitation was below normal in all divisions, although several southeastern localities received more rainfall than usual. The highest temperature reported in the State was 101° at East Saint Louis on the 26th, and the low for May was 30° at Stockton on the 13th. A severe storm of wind and hail struck northern Iroquois County on the 22d, causing an estimated $1,000,000 damage to property and crops. Two tornado funnels were observed aloft at Palestine on the 7th, but the funnels did not reach the surface.

JUNE -- Unusually high temperatures were the outstanding feature of this month's weather. Only three times in 64 years of State-wide records have June temperatures averaged higher. The top reading of 108° at Palestine on the 20th tied the record for the month. The lowest temperature during June was 40° at Freeport on the 2d. Rainfall averaged below normal again except in the northern division, as dry weather continued from the latter part of May into early June, and another dry spell extended from the 15th to the 23d. A number of damaging local storms occurred during the first half of the month, and a line of thundersqualls (about 50 miles wide) swept nearly the length of the State on the 13th, causing $500,000 properly damage and injuring several persons.

JULY -- This month averaged a little warmer and wetter than normal, but there was considerable variation in precipitation over the State. Most of the north and east-central portions received generous rainfall amounts, while the south and many west-central localities were rather dry. Pastures deteriorated in the drier sections during July. Temperature extremes during the month were 108° at Alton on the 29th and 47° at Freeport on the 10th. A number of damaging local storms were reported in the northern half of Illinois during the early part of July. On the 5th high winds caused damage to several northern and central communities.

AUGUST -- Very dry weather prevailed with an average of only 1.12 inches of rainfall over the State. Since State-wide records began in 1890, only one other August, that of 1893, has been drier. The greatest deficiency of rainfall was in the southern third which averaged only 0.79 inch. Practically all the rainfall occurred during the first 16 days of the month. Temperatures averaged slightly above normal, the highest reading during August being 106° at Alton on the 1st, and the lowest was 44° at three northern stations on the 19th and 20th. Hot, dry weather during the last 2 weeks of the month forced maturity of corn and soybeans, and also reduced prospective yields, especially in late planted fields. Hailstorms on the 7th severely damaged corn and soybean crops in several northern counties and hit apple and peach orchards in the Anna-Cobden area.

SEPTEMBER -- As in the preceding month, rainfall continued deficient, averaging 1.59 inches, which is less than half of normal. The southern third again was the driest portion of the State, averaging only 0.61 inch. Temperatures were a little above normal, with the hottest weather occurring the first 2 days of the month and again near the end of September, most stations registering 100° or higher in one or both periods. The maximum reported was 108° at Flora on the 1st. Killing frost occurred in extreme northwestern Illinois on the 22d, and the minimum reading for September was 31° at the Vandalia CAA station on that date. Because of the early maturing of crops, nearly all corn was safe from frost before the end of the month, and the soybean harvest was well under way. High winds accompanying thunderstorms caused considerable damage in several northern and north-central counties on the 26th.

OCTOBER -- Dry conditions and mild temperatures were the predominate features of October's weather. Unlike the preceding 2 months, however, this time the southern division received the most rainfall, averaging 2.16 inches compared with the State-wide mean of 1.56 inches. Practically all precipitation occurred during two periods, the 2d-6th, and the 26th--28th. Temperatures averaged more than 3° above normal; they ranged from 98° at Albion and Harrisburg on the 2d to 22° at Sycamore on the 29th. The fall harvest was nearly completed during October, as dry weather hastened maturity of all crops.

NOVEMBER -- Sunny, dry, and mild conditions prevailed during most of November. The first snow of the season fell in the northeast on the 5th, but otherwise practically no precipitation occurred before the 18th. Rain or snow fell frequently during the latter part of the month, but precipitation amounts often were light. Precipitation averaged only 0.90 inch, about two-fifths of the normal value. Temperatures averaged considerably above normal, particularly in the north. The maximum for the month was 79°, registered at Harrisburg on the 2d, and the minimum of 5° occurred on the 28th at Aurora. Because of the continuing shortage of rainfall, many wells were dry and community water resources were low, especially in the south and west-central portions.

DECEMBER -- Northern Illinois received substantial precipitation this month, but southern and most of central Illinois continued to be rather dry, making this the fifth consecutive month with a below-normal precipitation average. Temperatures continued to average above normal, the extremes being 68° at Harrisburg on the 5th and 12° below zero at Stockton on the 17th. Most of the southern third received only a trace of snow, but in the north snowfall ranged up to 13 inches at Mount Carroll. Despite the lack of precipitation, winter wheat mainly was in good condition, although top growth was short.--GRJ

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

-	No record.
+	Also later date (dates) or months.
*	Amount included in following measurement.
//	Gage is equipped with a windshield.
B	Adjusted to full month.
E	Amount is wholly or partially estimated.
M	Less than a complete month of record available; if average value is entered, less than 10 days of record are missing; see monthly Climatological Data for detailed daily record.
R	Data from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.

Subscription Price: 15 cents per copy; monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 4-9-54 -- 1150

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

ILLINOIS

JANUARY 1954

Volume LIX No. 1

KANSAS CITY: 1954

ILLINOIS - JANUARY 1954

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Weather conditions during January followed the pattern of the past several months, averaging warmer and drier than normal. Precipitation amounts varied considerably, less than an inch falling in northwestern and many west-central localities but stations near the southern tip of Illinois receiving over 4 inches during the month. Precipitation over the State averaged 1.66 inches, which is 0.67 inch below the January normal. Temperatures during the month averaged 29.6°, or 1.9° above normal, with the greatest departures in the north and cetnral portions. No severe storms occurred this month, although a number of persons were injured in falls on ice after freezing rain covered much of the State on the 26th.

The first half of January was very dry, except for a heavy snowfall in the southernmost counties on the night of the 9th-10th, when amounts up to 7 inches were reported. Most of the southern third of the State received substantial rainfall on the 14th-15th, but few northern or central stations registered any precipitation of consequence before the 20th. On that date, rain, followed by snow in the north, covered the entire State, the heavier amounts occurring in the south and east-central portions. Another general rain, with snow in the northwest and extreme north, fell on the 26th. Much of this rain was in conjunction with freezing temperatures, resulting in a heavy glaze in many localities, especially in the central portion. Precipitation totals at individual stations this month ranged from 6.05 inches at Glendale Experimental Farm to only 0.33 inch at Avon. The heaviest total snowfall was 9.0 inches at Harrisburg Disposal Plant, but the State average was only 1.9 inches.

Mild temperatures prevailed as the month began, and they continued until colder weather moved into the State on the 9th. A considerable number of central and southern stations registered their monthly maxima on the 8th, when temperatures rose as high as 67° at East St. Louis. Subnormal temperatures were dominate after the 9th until the 19th, except foraa brief rise on the 14th and 15th. The lowest reading of the month, 15° below zero, was registered on the 17th at Stockton. From the 19th to the end of the month temperatures were mainly above normal, although two or three bried cold spells occurred during that period. On the 20th some of the highest temperatures of the month were registered; Cairo reported 67° to equal the mark set at East St. Louis on the 8th. Mean monthly temperatures at individual stations this January varied from 37.0° at Elizabethtown to 20.5° at Stockton.

Little agricultural activity was reported during January. The generous precipitation received in the extreme south served to relieve the dry soil conditions in that section of the State.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

①	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

FEBRUARY 1954

Volume LIX No. 2

KANSAS CITY: 1954

ILLINOIS - FEBRUARY 1954

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Unusually mild weather prevailed during most of this month, the average temperature of 40.4° being 10.5° above normal and equaling the record set in February 1930. However, from data available at stations in operation before State-wide records were begun in 1890, it appears that February 1882 was slightly warmer than this month. Cairo's mean temperature of 47.3° was the highest in the State, while the Rockford CAA station averaged coldest with 33.9°. Precipitation averaged 1.84 inches, or 0.08 inch below normal, most northern stations receiving somewhat heavier amounts than usual, while southern and central localities generally were deficient in moisture. The greatest total precipitation reported during February was 3.79 inches at Streator, and the least amount was 0.56 inch at Rockport. Snowfall averaged only 2.3 inches, ranging from 11.0 inches at Dixon to none at several southern and a few central stations. Thunderstorms and windstorms on the night of the 15th-16th caused some damage in several localities scattered throughout the State.

Except for a few short-lived cold spells, temperatures remained well above normal throughout the month. The coldest day of this February was the 12th, the lowest temperature registered being zero at Stockton. Rapid warming occurred after the 12th, and by the 15th most of Illinois had afternoon temperatures in the 60's and 70's, with a maximum of 77° at East St. Louis. Although lowering somewhat after the 15th, temperatures still continued above normal during the latter half of February except for a few days near the end of the month.

Some snow and rain fell in northern and east-central Illinois on the 2d and 3d, but otherwise the first half of the month was quite dry. This dry spell was ended by heavy thundershowers on the night of the 15th-16th, when many stations received more than an inch of rain. Light to moderate rainfall was general between the 19th and 21st, and rain or snow occurred frequently during the last few days of the month.--GRJ

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

ⓘ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

MARCH 1954

Volume LIX No. 3

KANSAS CITY: 1954

ILLINOIS - MARCH 1954

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Illinois weather during March 1954 consisted of below-normal temperatures in all sections, above-normal precipitation in the northern third of the State, and below-normal precipitation in the southern two-thirds. Average temperature for the entire State was 38.5°, which is 2.5° below the normal. However, the average was not near the record high and low averages for March, which are 52.7° for the high average and 31.4° for the low. Warm periods during the month were around the 12th and from the 25th to the 28th. The highest temperature recorded in the State during the month was 79° at Carbondale on the 25th and at East St. Louis on the 28th. Coldest period was from the 3d to the 6th, except in some areas of the extreme north where the 30th was also quite cool. The lowest temperature reported was 1° below zero at Aurora College on the 6th.

Although precipitation for the State as a whole averaged below normal, the last 8 days of the month brought frequent and rather heavy rains. The rains of the 24th and 25th particularly were heavy for the first time in a number of months. Twenty-four hour amounts in excess of 2 inches occurred at a number of points in the northern third of the State. These rains at the close of the month brightened the agricultural outlook and diminished somewhat the prevailing subsoil moisture deficiency. The greatest monthly fall was 10.50 inches at Skokie, and the least was 0.75 inch at Chester. Precipitation occurred on the 2d and 3d, again between the 10th and 14th, and around the 19th, but for the most part precipitation during these periods was mostly light. A large monthly snowfall total, 19.9 inches, was recorded at Chicago, however, the greater portion of this fall was due to a 12 inch "lake effect" snow on the 3rd. This heavy fall was confined to the area close to Lake Michigan and was not representative of any appreciable portion of the State.

At the close of the month, wheat was in excellent condition and preparation of the ground for planting of corn and soybeans was well underway.--PFS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

© Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
- No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+ And also on a later date or dates.
* Amount included in following measurement, time distribution unknown.
// Gage is equipped with a windshield.
B Adjusted to a full month.
C Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R Amounts from recording gage (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T Trace, an amount too small to measure.
V Includes total for previous month.
SS This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

[illegible]

Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

APRIL 1954

Volume LIX No. 4

KANSAS CITY: 1954

ILLINOIS - APRIL 1954

C. E. Lamoureux, Section Director - Des Moines, Iowa

WEATHER SUMMARY

This was the warmest April in Illinois in the past 29 years and the fourth warmest in the period of record, -65 years. The average temperature for the State, 58.0°, has been exceeded only in 1896, 1915 and 1925. In the extreme southern part of the State it was the second warmest of record, with only April 1896 recording a higher mean temperature. Temperatures during the month ranged from a high of 90° at Palestine on the 25th to a low of 11° at Stockton on the 3rd. The first few days of the month were cold, but the remainder of the month was warm, with only a few short breaks of below normal temperature. The most persistent warm spell was from the 18th through the 27th, with the warmest weather of the month occurring on the 24th, 25th and 26th.

Precipitation for the month averaged 4.15 inches, or 0.60 inch above the normal for April. It was the first month since July 1953 with a State precipitation average above normal. In the preceding 12 months, April 1953 through March 1954, a precipitation deficiency of 11.28 inches had accumulated in Illinois. The greatest portion of the deficiency had accumulated during the late summer and fall, August through November, when drought conditions became acute. In general the heaviest precipitation fell over the northern third of the State where the average amount was nearly 5 inches, while the least fell over the southern third, where the average was slightly more than 3 inches. The heaviest fall reported was 9.40 inches at Table Grove in the west-central portion and the least reported was 1.34 inches at Red Bud in the southwest.

The dry fall and winter had been ideal for field work such as plowing, spreading manure and fertilizing on Illinois farms. As a result April began with a record proportion of plowing for spring crops completed, about 60 per cent of the total intended acreage. Some of this advantage was lost during the month because of frequent rains, particularly in the northern counties. But on the whole, spring work on the farms continued ahead of the average season. Oat seeding, which was off to a good start the first week, was delayed in the northern counties the second week, but was virtually completed at the close of the month. This was a few days later than in 1953 but was about a week earlier than normal. Plowing for spring planted crops continued ahead of schedule, and was about 5/6 completed at the close of the month, which was ahead of 1953 and compared with a normal of about 5/8 completed. Some planting of corn began in the south after the middle of the month and by the close of the month had progressed northward to mid-State. For the State as a whole, less than 20 per cent of the intended corn acreage had been planted by the end of the month and less than 10 per cent of the intended soybean acreage. The greatest progress was in the southern part of the State where there had been 23 days with weather suitable for field work as compared to only 13 days suitable for field work in the northern part of the State during the month. Soil moisture conditions, which had been deficient except in the northern counties at the beginning of the month, were generally improved. Freezing temperatures the first few days of the month resulted in a complete kill of peach blossoms in scattered blocks but for southern Illinois there was little reduction in the prospects for the peach crop. Strawberries were in bloom in mid-month, but a short crop was anticipated.

SEVERE STORMS

A severe tornado first touched the ground near Saunemin in Livingston county on April 3rd about 3 p.m., then lifted, but touched the ground again in southwest Kankakee county, moved N 58° E across the village of Indian Oaks for a distance of 15 miles. There were 8 homes destroyed, 30 more damaged, and 30 other buildings destroyed and 46 damaged. Total damages were estimated at $246,000. One life was lost and 13 other persons were injured when the tornado wrecked a small home. It was reported that the funnel cloud was "bell-shaped". On the same date severe windsqualls were reported near Pekin and Mattoon. In the northern tier of counties severe hailstorms were reported in the early afternoon and evening of the 7th. Damage was especially severe in Belvidere where hailstones the size of golfballs broke all greenhouse glass. North of Marengo heavy rains flooded farm homes.

Earlier in the month damaging windsqualls had been reported on the 1st over an area 15 to 25 miles wide from southern Macoupin county to Coles county and also locally in northeastern Illinois. On the 6th in the very early morning hours a severe windsquall struck grain storage bins northwest of Kinderhook in Pike county. Total damage to the area was estimated at $10,000. Wind damage was also reported from Allerton and Altamont in central Illinois and from Mt. Vernon and Johnston City in southern Illinois.

Late in the month windsqualls again caused damage over widely scattered communities in the State. On the evening of the 24th extensive damage was suffered in extreme northern Illinois, with damages estimated at $20,000 to buildings in the vicinity of Scales Mound, Blaine and Freeport. On the afternoon of the 26th windsqualls were reported in southern Illinois, with major damage to Shawnee School in Union county and minor damage reported in Carlinville and Sanderson Grove. Then in the late afternoon of the 30th a series of windsqualls caused light damage in the vicinity of Belleville, Carlinville, Carthage, Gillespie, Jacksonville, Litchfield and other places in central and southern Illinois. A farmer was killed in a storm accident near Hillview.- CEL

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

① Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
- No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+ And also on a later date or dates.
* Amount included in following measurement, time distribution unknown.
// Gage is equipped with a windshield.
B Adjusted to a full month.
C Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R Amounts from recording gage (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T Trace, an amount too small to measure.
V Includes total for previous month.
SS This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

MAY 1954

Volume LIX No. 5

KANSAS CITY: 1954

ILLINOIS - MAY 1954

C. E. Lamoureux, Section Director - Des Moines, Iowa

WEATHER SUMMARY

Whereas the preceding month had been warm and wet, the month of May 1954 in Illinois was cool and dry. The average temperature for the State was 59.0°, or 3.7° below the normal. It was the coolest May since 1945 and the 8th coolest during the period of state-wide records beginning in 1890. The highest temperature in the state, 98°, occurred on the last day of the month at Golconda Dam No. 51. The lowest temperature, 26°, occurred on the 6th at Stockton.

The average precipitation for the State was 2.77 inches, or 1.36 inches below the normal for May. The heavier rains occurred in the southern third of the State where the deficiency was only one-half inch. The heaviest precipitation reported was 5.85 inches at Ste. Marie near the Wabash river while the least was 0.48 inch at Rockport on the opposite side of the State near the Mississippi.

Warm weather at the beginning of the month soon gave way to persistent cold weather, lasting from the 3rd through the 13th. Record low temperatures were reported from several stations on the 4th with killing frosts general in the north and light frosts extending well into the southern part of the State. High pressure was persistent over the State throughout this cold period, and was the dominant pressure pattern the remainder of the month. Brief interruptions occurred when low pressure troughs crossed the State, the most important of which occurred late in the month from the 26th through the 28th when a warm front moved northward across the State in advance of a low pressure trough moving towards Illinois from the west. General rains, which were most beneficial, occurred in connection with the moving warm front. The month closed as it had begun, with warm weather. The highest temperature reported in the State occurred on the 31st at Golconda Dam on the Ohio River. Most of the rainfall reported occurred either early or late in the month, with only scattered showers reported from the 8th through the 25th.

In many respects the weather during the month had been favorable for agriculture in Illinois, but there were a few important exceptions. Corn planting was near completion at the close of the month, with 95 per cent of the intended acreage planted. Similarly, nearly 90 per cent of the intended acreage for soybeans had been planted by the close of the month. These percentages indicated that the planting of both crops was one week to ten days ahead of normal schedule. Cutting of alfalfa and red clover was underway at the close of the month, with about one-fourth the alfalfa acreage and one-sixth to one-fifth of the red clover acreage cut. Considerable insect damage was noted in central and southern districts. Fall planted grains and oats were making satisfactory progress, despite the moisture deficiency and weather conditions favorable for insect populations. Perhaps the most disappointing prospects were in the permanent pastures, which had not recovered fully from the effects of the previous season's dry weather. A short crop of strawberries had been harvested, but indications were that a heavy set of peaches could be expected in Illinois. Frost damage to apple blossoms was reported in northern areas but occurred only in scattered orchards in southern and western Illinois.

SEVERE STORMS

On the 27th a warm front moved northward across the State, accompanied by windsqualls beginning about 3:00 p.m. and ending shortly after 7:00 p.m. Many small buildings were damaged. A tornado was reported at Aurora between 6:30 and 6:45 p.m., which moved northeastward in the Chicago suburban area for a distance of 7 miles, unroofing 8 homes and causing extensive damage to trees and communication lines.

The following day, the 28th, a squall line preceded the eastward movement of the cold front of the low pressure system. A tornado was reported between 6:15 and 6:35 p.m. about 3 miles northwest of Eureka in Woodford county, which caused severe damage to five farmsteads. Heavy hail was reported in the vicinity of Spring Bay and Metamora in western Woodford county. Heavy loss was reported to the melon crop in the Spring Bay area. A few of the hailstones were reported to be as large as oranges. Hail was also reported on the 28th to have caused heavy damage to wheat and some damage to corn and soybeans in Adams county.

On the last day of the month a complex low pressure system approached the State from the west. Severe windsqualls broke out in a number of communities in northern and central Illinois between 10:30 and 11:30 p.m. The most extensive wind damage occurred at Sheldon in Iroquois county, Brownstown in Fayette county and at St. Paul in Fayette county. Large trees were blown down and extensive damage to power and communication lines was reported. Earlier that afternoon damaging hailstorms were reported in Schuyler, Fayette and Richland counties, while light hail fell in many other places in central Illinois. Crop damage was severe, especially to wheat in Schuyler county. Between 3:15 and 3:45 p.m. a tornado caused damage intermittently along a path which extended for a distance of 23 miles from near Delray to the vicinity of Chebanse in eastern Illinois. Severe damage occurred on ten farmsteads, seven houses in the Clifton area, and one building in Clifton.--CEL

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

⦶	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

JUNE 1954
Volume LIX No. 6

KANSAS CITY: 1954

ILLINOIS - JUNE 1954

C. E. Lamoureux, Section Director - Des Moines, Iowa

WEATHER SUMMARY

It was the third consecutive June with average temperatures 4° or more above the normal. The average temperature for June 1954 was 76.3°, which was 4.2° above the normal for the month. It was also the sixth warmest June in a period of 65 years, with higher mean temperatures recorded only in 1934, 1933, 1952, 1953, and 1921. Over most of Illinois, the first five days were below normal in temperature while the remainder of the month was above normal. At Springfield there were 16 days with temperatures 90° or higher, - half the normal number for the entire summer season. At Chicago new daily record maxima were attained for seven days in the month, on June 13, 14, 15, 18, 21, 25 and 29.

Precipitation for the month averaged 3.56 inches, which was 0.46 inch below the normal. Amounts varied widely over the state, from a maximum of 7.97 inches at Cobden to a minimum of 1.00 inch at Carlyle and Palestine. In general the northwestern third of the state and the extreme southwest recorded amounts in excess of the normal while the remainder of the state experienced below normal rainfall.

The month opened with a low pressure system moving from southeastern Iowa to the Georgian Bay region, which was followed by a high pressure system which dominated the weather over Illinois for the next several days. The coolest weather of the month was associated with this influx of Canadian air. A minimum temperature of 40° occurred at Cobden on the 5th in this cool air mass. There followed a succession of weak pressure systems, with temperatures continuing near or above normal throughout the rest of the month. The highest temperatures occurred during three periods, the 11th through the 14th- when small low pressure systems moved well to the northwest and north of Illinois, from the 18th through the 21st when a frontal system stagnated over Iowa, leaving Illinois in the warm air, and on the 26th. The highest temperature in the state, 108° at Palestine occurred on the 26th when a weak high pressure system dominated the southeastern states and warm air covered Illinois.

On the whole, June was a favorable month for most agricultural crops in Illinois. During the first week of the month one-third of the alfalfa and red clover crops were cut, but some of the hay was damaged by the wet weather. By the middle of the month half of these crops had been cut and the combining of barley had begun in the south. The hot weather the last three weeks of the month hastened the growth of corn and soybeans. By the close of the month fields of early planted corn had been cultivated for the last time. Corn averaged 42 inches over the state, which was 6 inches higher than normal for the close of June. Prospects were for the third largest crop of record, averaging 57 bushels to the acre.

As the month closed over half of the wheat acreage had been combined. High yields and good quality were general, with a statewide average yield estimated at 28.5 bushels to the acre, the heaviest since 1937, and 9 bushels above the average. Oats, on the other hand, had been hurt by the hot weather, and the crop was estimated at 6% below the 10-year average. Weather conditions had been such that early planted oats in the south and delayed plantings in the north appeared to have given the best results.

Although slightly damaged by insects and the hot weather, the hay crop was estimated at 6% above the 10-year average. At the close of the month most of the first cutting of alfalfa and red clover had been harvested, and the second cutting of alfalfa was well along in the south. Soybean stands were good across the state, and the crop was making satisfactory progress.

Vegetables and fruits did not hold the same promise as the staple crops of the state. Yields of snap beans, tomatoes, sweet corn, cucumbers, cantaloups, were 20% or more below the average, while cabbage and watermelons were estimated 7 to 8% below the average. Peaches were ripening in the south with the picking of Red Havens begun in Johnson county. The crop was generally in good condition and well-sized. A yield 7% above 1953 but 29% below the 10-year average was estimated.

SEVERE STORMS

June was a month of frequent windstorms, with more or less damage reported on more than half the days of the month. On the 1st a severe windsquall struck Bloomington around 12:30 a.m. with the windspeed estimated 80 mph. Heavy damage was inflicted upon trees, power and communication lines; 4,000 telephones were out of order. Major damage was reported to six homes, and to the roofs of some downtown buildings. Damages in Bloomington were estimated at $500,000. On the 2nd of the month heavy rains and strong winds caused minor damage at scattered localities in the state. Bottomlands were flooded by the rivers in the northwest, north-central and extreme south, while severe erosion of cropland was reported in the extreme south. On the 3rd a windstorm caused damages estimated at $200,000 in the greater Chicago area, with principal damage to trees, power and communication lines, canopies, awnings and porches. Minor injuries to two persons occurred in connection with the windsqualls. On the 5th five heifers were killed by lightning in the vicinity of Payson in extreme western Illinois.

On the 7th severe hail was reported over an area 2 miles wide and 7 miles long in southwestern Champaign county between Bondville and Tolona. Hailstones the size of walnuts caused extensive damage to corn and soybeans. Two days later another hailstorm caused damage to greenhouses in Winnetka estimated at $500, while minor damage from strong winds was reported in extreme southern Illinois. Minor wind damage occurred again on the 13th over scattered localities in central Illinois, particularly at Pana and Springfield where two airplanes were overturned at the airport.

Table 6 for this issue may be found on Page 68.

WEATHER SUMMARY (Continued)

On the 15th there were more numerous windsqualls in central and northeastern Illinois, the most severe of which damaged 3 farms in the vicinity of Naperville, west of Chicago. Wind damage at Kankakee was estimated at $1900. At Pekin an airplane was overturned while at Springfield a building was demolished. Minor damage was also reported in the south in the vicinity of Belleville and in the extreme west in the vicinity of Ursa.

On the 20th a severe windsquall demolished 3 buildings on the Logan county fairgrounds at Lincoln. Heavy hail fell over scattered areas on this date, with damage to crops reported in the vicinity of Middletown, Brocton and Ogden. A woman was killed by lightning at Virginia. Very heavy rains and some wind damage was reported at Roanoke in Woodford county. On the 21st a heavy rain and windstorm occurred over southern Wisconsin and the adjacent protions of northern Illinois, especially in the Pecatonica basin. Damage to trees and to power and communication lines was particularly severe in Durand, Rockford and Belvidere. At Rockford a person drowned while swimming in the Rock River when the windsquall struck. Near Galena there was minor damage to farms; a cow was killed by lightning. Near Reddick in Kankakee County 15 pigs were killed by lightning with a loss of $1500. On the 23rd what appeared to be a 'dust-devil' moved from Litchfield to the east of Hillsboro. A garage was unroofed and other minor damage occurred in Litchfield, while trees were blow down east of Hillsboro.

Early in the forenoon of the 26th a brief squall disturbed the waters of Lake Michigan, producing a seiche, with the height of the water rising suddenly 3 to 8 feet, the greatest rise occurring in Montrose harbor. Fisherman were swept off the piers and swimmers out into Lake Michigan. Many were rescued, but eight lives were lost. On the 27th a severe windsquall struck the small town of Millstadt in southern Illinois when a picnic with 400 persons attending was in progress. There was extensive damage to trees and minor damage to buildings and other property. On the 28th a windsquall caused minor damage on a farm near Chana in northern Illinois.

A series of windsqualls occurred across northern Illinois on the 29th, causing extensive damage to trees and to power and communication lines. The most severe of these squalls damaged farms in the vicinity of Milledgeville, Shannon and German Valley in the early afternoon; and damaged the hotel, boats and recreation facilities at Fox Lake in the late afternoon. Other communities reporting damage were Rockford, Belvidere, DeKalb and Menota. At Elgin heavy rains flooded the streets. Automobile accidents directly attributed to the local storms caused one death at Mascoutah, and seven injuries near Ottawa and Kankakee.--CEL

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

① Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
- No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+ And also on a later date or dates.
* Amount included in following measurement, time distribution unknown.
// Gage is equipped with a windshield.
B Adjusted to a full month.
C Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T Trace, an amount too small to measure.
V Includes total for previous month.
SS This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 8-20-54 -- 965

CORRECTIONS

February 1954: Streator, Table 3, precipitation on the 25th should be .25, total 2.52.

March 1954: General Summary, 2nd paragraph, 7th line, the greatest monthly fall was 7.15 inches at La Salle 1 S.

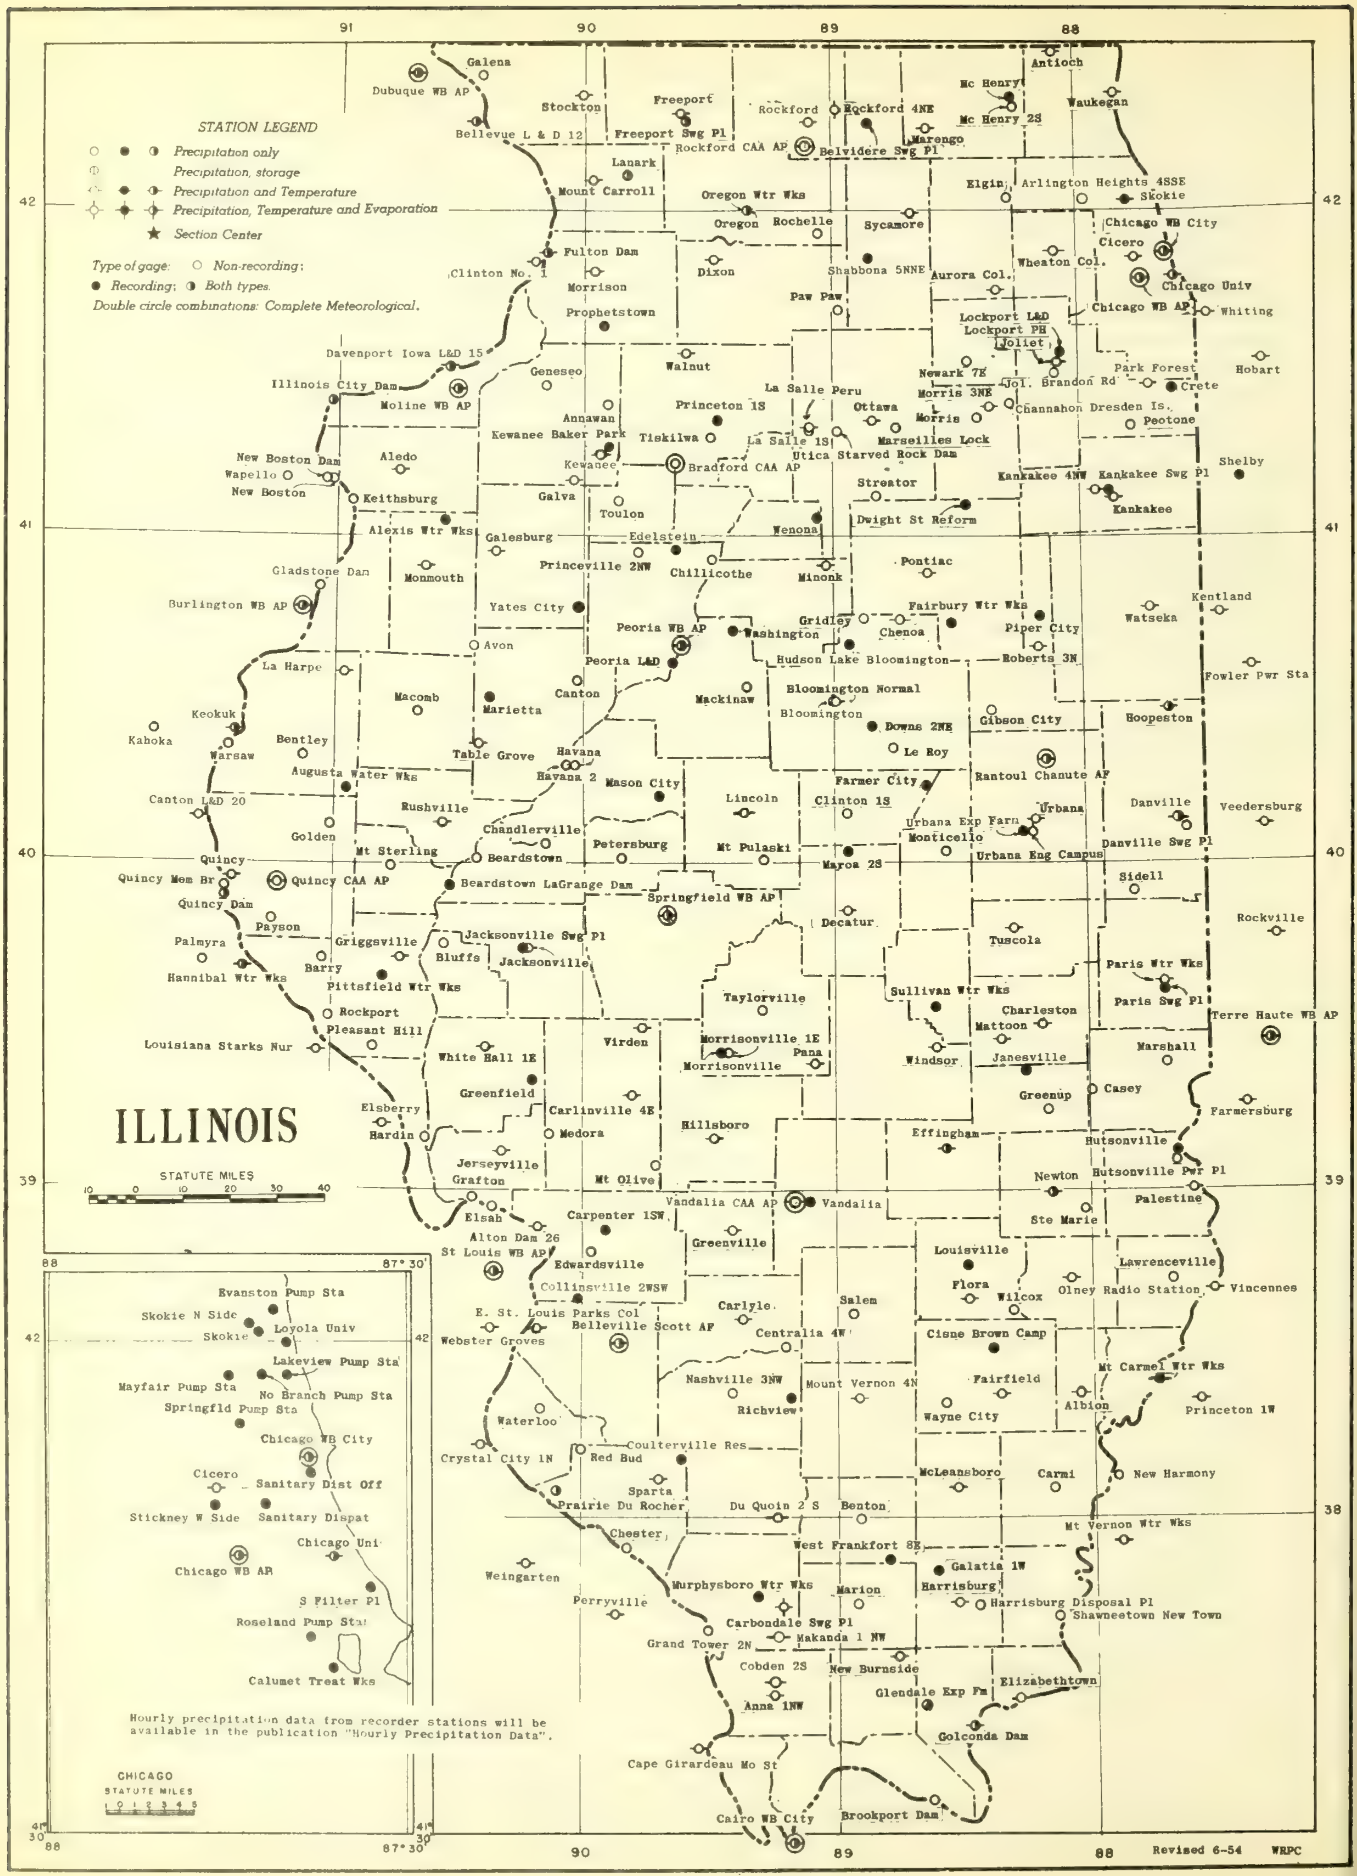
Table 1, Average Precipitation for the year 1954 should be 2.50.

Skokie, Table 2, total precipitation should be 4.20, greatest day 2.74 and days .50 or more 1.

Northern division average should be 3.98 and departure +1.40; state average should be 2.50 and departure - .70.

Skokie, Table 3, 2nd should be .10, 3rd 16, 10th T, 11th .02, 12th .23,13th .12, 14th T, 19th .28, 22nd .01, 24th .13, 25th 2.74, 28th .13, 29th .28 and total 4.20.

April 1954: Lanark, Table 3, precipitation on the 5th should be .25, total 4.59.



ILLINOIS

JULY 1954
Volume LIX No. 7

KANSAS CITY: 1954

ILLINOIS - JULY 1954

C. E. Lamoureux, Section Director - Des Moines, Iowa

WEATHER SUMMARY

This was the hottest July in Illinois since 1936. The average temperature for the State, 79.3°, has been exceeded in only 5 times in 65 years, 1901, 1916, 1921, 1934 and 1936, and equalled once in 1931 during the period for which Statewide records were available. A new record high temperature for the State was set with 117° recorded at Parks Air College in East St. Louis on the 14th, exceeding the old record of 115° made at Greenville on July 12, 1936. Parks Air College also had the highest mean temperature for the month, 85.9°, and recorded 100° or higher on 17 days. The hottest periods for the month were from the 12th through the 14th and the 18th through the 20th. In southern Illinois only 7 days of the month had normal or slightly below normal temperatures; all of the rest had above-normal temperatures.

Precipitation for the State averaged 2.79 inches, or 0.44 below the normal. It was the driest July in the last 7 years. Deficiencies of about 1 inch were especially noticeable in the southern and central sections of the State, with Waterloo recording only 0.42 inch for the entire month. In contrast to the dry conditions in the southern and central counties, precipitation was ample in the northern counties, with an excess of 3/4 inch above the normal for the month, and where Chicago University recorded a total of 6.37 inches.

Good rains fell in northern Illinois during the period of the 3rd through the 7th. A succession of weak pressure systems that followed gave only a few scattered showers. During the hottest weather of the month a high pressure system aloft blanketed the area from Oklahoma to western Tennessee, effectually shutting off sources of moisture as well as adding to the heat. Beginning on the 20th a frontal system which moved southward across Illinois and became stationary near the extreme southern tip of the State gave copious rains over most sections. At Pittsfield, Illinois 4.80 inches of rain fell within 3 hours in the early morning hours of the 22nd. On the 28th and 29th a weak squall line gave scattered showers across the central counties.

The effect of the July weather upon agriculture in the State was quite variable. It appeared that northern Illinois would harvest normal crops, with yields in some localities well above the normal. In the central part of the State drought conditions, accompanied by exceptionally high temperatures, were so severe that the Governor asked that 41 counties be declared eligible for disaster relief. In much of the 41-county area the corn crop would be a total failure, although the condition was variable and a few localities would produce normal crops. In the extreme south conditions were again close to normal. A record wheat yield of 28.5 bushels to the acre had been harvested before the severe drought conditions had begun. Similarly the major portion of the hay crop had been harvested, although the second cutting had been severely curtailed, and a total crop close to the 10-year normal was expected. Oats were better at harvest time than expected, with the harvesting practically completed at the end of the month. The estimated yield for the State was 44 bushels to the acre, well above the 10-year average of 39 bushels. A normal crop of soybeans was anticipated, largely through a large increase in acreage. The yield had been materially reduced by the drought conditions in the central area of the State. The effects of the drought were especially severe in respect to the corn crop and pastures. Throughout much of the drought area the corn crop was a total failure. Some of the corn would revive and produce a small crop for silage. But the crop in Illinois was reduced by 100,000,000 bushels, and the estimated yield per acre reduced from 57 to 45 bushels to the acre. Pastures were in very poor condition throughout the drought area, with many farmers baling straw in anticipation of a shortage in forage.

Many factors went into the drought situation. Subsoil moisture supplies had never been fully replenished since the long-continued drought of the previous year. As the month closed water shortages were reported in 34 communities in south-central Illinois, in an area closely approximating the 41 counties where drought relief had been requested. Precipitation in May had been generally below normal in all sections of the State, with the deficiency more widespread in the central section. In June there were ample rains in the northern counties and also in the southwest. But large areas in the central part of the State and also in the southeast were with less than normal rainfall. And in July it was the central and southern sections which were again deficient in precipitation while the northern counties, particularly the northeast, received ample amounts. But it was the searing heat that caused the greatest damage to the crops during the period of deficient rainfall. Hillsboro, near the center of the area of water shortage, is typical of the hot weather experienced although conditions there were not so extreme as in the East St. Louis area. At Hillsboro afternoon temperatures went above 90° on June 10 and continued above 90° until the end of July except for seven days when rain or cloudy weather held the maximum temperatures in the eighties. The average maximum temperature for the 52 day period was 97°, and there were 14 days with temperatures 100° or higher. The high temperatures increased the water requirements in a season of deficient rainfall. In Illinois 14 deaths were attributed to the heatwave; and there was a heavy loss of hogs and poultry.

SEVERE STORMS

On the 2nd through the 5th of the month there were scattered wind and hailstorms. In the west-central area from Jacksonville to Middletown extensive minor wind damage was reported and one building was unroofed. In southern Champaign County from Sadorus to Longview damaging hail fell over 11 square miles. In the Chicago area a man was killed and two were injured in windsotrms, a 20 foot stack was blown down and a $76,000 cruiser was beached. The windstorms shifted to southern counties on the 4th with minor damage near Hillsboro, damage to farm buildings near Coffeen, and also in the early morning near East St. Louis. On the 5th hailstones 3 to 4 inches in diameter were reported near Rockford, where the radio station was forced off the air because of wind damage.

WEATHER SUMMARY (Continued)

On the 6th of the month the most damaging wind and hailstorms of the season occurred in northern Illinois north of a line extending from Clinton, Iowa to Watseka, Illinois. The most severe wind damage was in the extreme northeast from Zion to the Wisconsin line. In Aurora streets were flooded by heavy rains; in Kankakee the fair building was unroofed; in Carroll County 450 telephones were put out of order and at Joliet the State Penitentiary suffered damages estimated at $25,000. Along the shore of Lake Michigan a seiche greater than that of June 26 occurred, but no lives were lost. There was scattered damage to farm buildings throughout the area. Scattered hailstorms occurred in northeastern Illinois, the most severe of which covered a 60 square mile area between Rockford and Winnebago. Hailstones the size of baseballs were reported. Loss to the corn crop alone was estimated at $300,000. Total damage on the 6th from wind and hailstones was estimated at $1,500,000.

On the 7th of the month a windsquall wrecked display tents on the county fairgrounds at Jerseyville. Severe hail was reported south and east of Jerseyville. At the fairgrounds 4 persons were injured and 10 others received attention for minor cuts and bruises.

On the 14th a small tornado moved 25 miles across Fayette County from the vicinity of Pittsburg to an area 4 miles southeast of Herrick. Extensive damage along the path of the storm included the Country Club at Vandalia, two buildings unroofed, plate glass blown out, trees uprooted, and three barns and other small farm buildings destroyed. One person was injured and six cattle were killed. On the same evening a severe windsquall demolished a Drive-In screen, a large barn and several smaller buildings near Casey in Clark County.

On the 20th of the month windsqualls damaged property at widely scattered places from the Peoria-Camden area southeastward. Heaviest loss occurred near Decatur where a Drive-In screen was demolished.

On the last day of the month a severe windsquall interrupted proceedings at Granite City where the grandstand was unroofed and the reviewing stand collasped. Thirteen persons were injured. At Noble one boy was killed when lightning struck a tree.--CEL

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

⦶	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

AUGUST 1954

Volume LIX No. 8

KANSAS CITY: 1954

ILLINOIS - AUGUST 1954

C. E. Lamoureux, Section Director - Des Moines, Iowa

WEATHER SUMMARY

August in Illinois was wet with above normal temperatures. It was the first month since April with above normal precipitation and the second in the year. The rains were particularly welcome in the central and southern counties where the effects of the drought and hot weather had sharply limited agricultural production. The average precipitation of 5.04 inches was the heaviest August precipitation in the last eight years and the seventh greatest August precipitation for the 65 year period of record.

In general the heavier amounts of precipitation fell over a wedge-shaped area extending westward and southwestward from Chicago and over a wide band extending from Keokuk, Iowa, southeastward to southern Indiana. The least precipitation fell over the extreme southern and southwestern counties and over portions of the east-central area. The heaviest precipitation in the State was 11.01 inches at the Fulton Dam, while the least was 2.46 inches at Prairie du Rocher.

The average temperature for the State was 75.4°, only 0.8° above the normal for the month. The highest temperature reported was 107° at Sparta on the 18th. The lowest temperature reported in the State was 43° at Stockton on the 12th. In general below normal temperatures prevailed from the 1st through the 13th and again on the last two days of the month while above normal temperatures prevailed from the 14th through the 29th.

The month opened with a weak high pressure system centered over Illinois and a weak front across the extreme southern tip of the State. Heavy showers fell in extreme southern Illinois. On the 2nd the front moved further south, but on the 3rd and 4th moved back into southern and central Illinois. Showers were again reported in the State on these days. With brief interruptions this pattern was to be repeated several times during the month. It was a month of frequent showers, occasionally heavy as weak waves moved eastward along the front. It was also a month of frequent windsqualls and electrical storms. Damage from lightning and from hailstorms was unusually heavy for so late in the crop season. On the 2nd a hailstorm damaged crops along a narrow strip extending for 28 miles from 2 miles north of Orion to 1 mile south of Kewanee. Wind squalls damaged plate glass and blew down trees in Rock Island. A corn crib was demolished near Virginia while lightning set fire to a barn which burned to the ground near Vermilion. More severe wind and hailstorms occurred on the 3rd, these are described under "Severe Storms". On the 4th damage from windsqualls was reported across northern Illinois, the most severe of which occurred in the Rutland-Streator-Cornell area where corn was flattened by the wind, trees were blown over, one barn was demolished, and other buildings were damaged. On the 5th of the month lightning set fire to the State Hospital at East Moline, with total damages estimated at $80,000.

On the 9th of the month a very weak disturbance moved slowly eastward across the upper Great Lakes and a very weak secondary developed over Illinois. This secondary disturbance was the cause of damaging wind and hailstorms which are also described below. On the 15th and 16th another front across Illinois was attended by severe windsqualls which uprooted trees and downed power lines in Pike county just after midnight on the 15th and later on the evening of the 16th caused heavy rain and hail the size of walnuts in Monmouth. In the Chicago area, streets were flooded and traffic slowed. Near Naperville a barn was struck by lightning and burned. Another wave on this same frontal system caused severe windsqualls on the 18th which are described below. Later in the month the windsqualls and rains were not so frequent, but in Chicago a boy was killed by a falling tree in a storm on the 24th. And on the 26th two persons were killed by lightning while golfing, one near Naperville and one near Lisle. The month closed on a fair weather note as a high pressure system moved southward from western Ontario bringing fair and cool weather to Illinois.

The rains early in the month checked the ravages of the summer drought. But they came too late to save the summer crops in the drought stricken areas of central and southern Illinois. Improvement was anticipated in much of the acreage devoted to soybean and forage crops, and in some of the corn in the fringe areas. In the south drought-damaged corn was used for filling silos before the close of the month. As the month closed it was possible to evaluate the beneficial effects of the timely rains. The estimate of the corn yield was increased by five bushels to the acre, with excellent yields anticipated in the northern counties but disappointing yields in the central and southern counties. Similarly the estimate of the yield of soybeans was increased by two bushels to the acre with the crop maturing a little later than a year ago. The total hay crop indicated was 4.4 million tons, which would be 10 per cent larger than the ten year average.

SEVERE STORMS

3rd. Central and southwestern Illinois. Scattered hailstorms from Mercer county southeastward to northern Macon county. Hailstones 7 inches in circumference were reported. The most severe crop damage occurred between Maroa and Forsyth in Macon county. The most intense storm occurred in the southwest over Plum Creek south of Marissa. There crops were ruined over a 12 square mile area; 3 planes were damaged by the hailstones; 137 windows were broken in one greenhouse. The hailstones were reported to be the size of goose eggs with a few as large as baseballs, and hail accumulated in some places to a depth of four inches. Poultry, rabbits, and four baby pigs were killed by the stones, while cattle in the fields were injured. Strong winds accompanied the hailstorm and unroofe buildings in the neighborhood.

WEATHER SUMMARY (Continued)

9th. Northern Illinois. Hailstorms struck in northern Illinois between 4:00 and 11:00 p.m. The most severe hailstorms occurred over a strip 20 miles wide extending from Whiteside county southwestward into northern Champaign county. In this strip severe hail was reported from: The Garden Plain and Cottonwood sections of Whiteside county; the LaMoille section of Bureau county; the Grand Ridge section of LaSalle county; the Flanagan to Chenoa sections of Livingston county; and the Cropsey-Gibson City-Rantoul section of the Ford and Champaign counties. Losses to corn and soybeans were heavy throughout this area, and to lima beans in the Gibson City-Rantoul section. Hailstones ranged from the size of marbles to the size of golfballs, with irregular stones the size of lemons in the LaMoille section.

9th. Central Illinois. Severe windsqualls struck several communities in central Illinois. The most severe windsquall unroofed the City Hall at Kewanee, and caused widespread damage to trees, power lines and communication lines in that city. Similar tree and line damage was reported from Armington, Bloomington and Danville.

18th. Central Illinois. A series of windsqualls in central Illinois caused extensive tree damage, breaking power and communication lines in many communities. The most severe of these squalls occurred within a 20 mile wide strip extending from the Pittsfield-Griggsville section in the west to the Georgetown-Danville section in the east. Broken power lines were responsible for 3 deaths. At the State Fair in Springfield tents were overturned while a radio tower south of Springfield was blown down. Near Beardstown a barn was struck by lightning and burned. At Quincy a large tree was toppled over by the strong winds, falling upon a car and injuring the 5 occupants. A roller rink tent at Jacksonville was blown down, injuring 3 more persons, while 2 more were injured in Springfield

Hail damage has been especially severe in Illinois during the 1954 crop growing season. Most of the hailstorms have been small in extent, and it has not been possible to secure damage estimates from each individual storm. However, insurance experts estimated that damaging hail had occurred in 90 counties, and one company alone reported a total of 13,000 claims. Total crop damage from hailstorms was estimated at $12,000,000.--CEL

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Φ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

SEPTEMBER 1954
Volume LIX No. 9

KANSAS CITY: 1954

ILLINOIS - SEPTEMBER 1954

WEATHER SUMMARY

September was warm and dry. During the past 65 years only two have been both warmer and drier than September 1954. These were in 1897 and in 1939.

Mean temperatures ranged from 64.7° at Freeport to 76.4° at Cairo. The mean of 70.8° for the State was 3.1° above normal. The temperature on the 1st day of September was near normal and six very warm days followed. Maxima were in the 90's in the north and exceeded 100° at many locations in the central and south on the 4th, 5th, and 6th. The highest temperature for the month was 107° at East St. Louis and at Palestine on the 4th and 5th. Cool weather prevailed from the 8th to the 12th, and the period from the 13th to the 20th was mild. A cold front followed by a vigorous high pressure area dropped temperatures on the 21st and brought the lowest readings of the month and the first reports of light frost on the 22nd and 23rd. The lowest was 34° at five stations, Freeport, Kewanee, Morrison, Mount Carroll, and Stockton on the 23rd. The frost caused no damage to vegetation. The latter part of the month was mild with maximum temperatures in the high 70's in the north and low 80's in the south on the 30th.

The only rains during the first 18 days were light widely scattered showers. A few favored locations in the south received generous showers on the 19th and 20th. Amounts in this storm ranged from a few hundredths of an inch at some stations to 6.75 inches at Centralia. From the 21st to the 27th, there was practically no rain but showers again fell the last three days. Totals for the month ranged from 0.11 inch at Hoopeston and Roberts to 10.06 inches at Centralia. In the triangular area from Chicago southwest to Springfield, and east to the state line, nearly all stations received less than one inch of rainfall. In the remainder of the State most stations received from two to three inches in the north and from three to four inches in the south except for a small area of five to ten inches around Centralia.

The dry weather favored the maturity of crops although pastures declined until the fourth week when showers brought some improvement. The weather favored outdoor farm work consisting of silo filling, plowing, fruit harvesting, haying and combining soybeans. The picking of corn for immediate feeding began. The moisture content of the corn was generally too high for safe cribbing. The month closed with corn and soybeans drying sufficiently for storage, and combining of the latter well along. Also, seeding of winter wheat and apple picking were progressing.

There were no severe storms during the month. Hail did occur at a few widely scattered locations. Soybeans and corn suffered hail damage in Crawford and Livingston counties, and scattered hail and windstorm damage occurred near Quincy and in some southern locations.

No serious flooding was reported.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Φ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield,
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

OCTOBER 1954

Volume LIX No. 10

KANSAS CITY: 1954

ILLINOIS - OCTOBER 1954

WEATHER SUMMARY

October was extremely wet and quite cloudy with unusually warm temperatures early in the month. Chicago had a record temperature for the 3d, 91° which was also a new high for the month. However, with cooler weather during the last half, the State average temperature 56.3° was only 0.4° above normal. The average precipitation, 522 inches, was 2.55 inches above normal. The Great Storm of the 9th to the 11th over the northern portion centered its fury in the Chicago area producing a deluge with rainfall totals for the period around 11 inches and causing the greatest flood in Chicago's history. A small tornado occurred near Homewood at the height of the storm and Waterman in DeKalb County reported two barns blown down on the afternoon of the 10th with a total rainfall through that date, 12.13 inches.

The synoptic picture associated with the northern Illinois storm of the 9th to the 11th presented a quasi-stationary front from the north receiving a flow of warm moist air from the south resulting in a comparatively narrow band of heavy precipitation and high winds on either side of an east-west line across the northern part of the State just south of Chicago. Well above normal temperatures were the rule during the first half of the month with periods of warming from the 1st to the 4th, the 8th to the 13th, and the 22nd to the 26th. The highest, 97°, was recorded at Greenville on the 3d while on the same date 90° or above was recorded at most stations. Below normal temperatures prevailed during the last half of the month with cooling periods from the 14th to the 20th and the 27th to the 31st. Lowest readings in all three divisions were recorded at practically all stations on the 30th and 31st with the temperatures mostly in the upper 20's. The average was 56.3° only 0.4° above normal.

Precipitation averaged 5.22 inches, 2.55 inches above normal. Heaviest amounts were in the northern division ranging from 4 to nearly 15 inches with most of the area receiving 8 inches or more, and the greatest totals were in Chicago and immediately west and south of the city. Nearly all of the central division had from 4 to 6 inches, while less rain fell in the southern division where amounts ranged from about 3 to 5 inches generally. The greatest monthly total, 14.86 inches, which was 11.99 inches above normal, occurred at Aurora College near Chicago. The least monthly total was 2.29 inches, 0.91 inches above normal, at Grafton.

Although some frost was reported early in the month, termination of the growing period for most vegetation occurred during the last two days when temperatures dropped to the 20s at most stations, with no station failing to reach the freezing point or below. Early in the month general rains slowed harvesting particularly in the north but the resulting replenishment of surface and subsoil moisture was favorable to fall plantings. Periods of no rainfall later permitted harvesting to proceed rapidly except in the north. By the month's end 78 percent of the corn had been picked and 93 percent of the soybeans had been harvested. Seeding of winter wheat was 97 percent complete and additional rainfall near the end of the month was most beneficial to fall seedings and pastures especially in the south where soil moisture was reported deficient. Soil moisture was reported as surplus by 8 percent of the observers, ample by 72 percent, and short by 19 percent.

The following was condensed from an article furnished us by Mr. R. E. Lautzenheiser, Climatologist, Weather Bureau Office at Chicago: On Saturday evening, October 9, 1954 heavy showers and thundershowers developed in the Chicago area and in the following 48 hours caused the greatest flood in Chicago's history. A brief respite Sunday after an all-night deluge Saturday night and Sunday morning was followed on Sunday afternoon by a line of heavy squally thunderstorms that moved across the area releasing more rain on the already flooded city. Near midnight darkness prevailed under low-hanging black clouds and a small tornado was reported near Homewood, Illinois followed by high winds eastward into northern Indiana. On Monday afternoon a brief period of heavy showers occurred in the city again when as much as 2 inches of rain fell on the south side of Chicago in a 2 hour period.

The official measurement of 6.72 inches in 48 hours, October 9-11, 1954 set a new record for that period. Reliable unofficial measurements from Chicago's southern suburbs gave a total of nearly 10 inches in 30 hours and nearly 11 inches in a 48-hour period.

Total damage was estimated at 10 million dollars in Chicago and 15 million in suburban areas. Among the properties damaged were hundreds of homes, thousands of basements, many highways, streets and viaducts, business houses, and sanitary facilities. For the first time since its construction some 50 years ago the direction of flow of the Sanitary and Ship Canal was turned back into Lake Michigan to relieve the flooded condition of the great city of Chicago. Among the suburban communities receiving the greatest flood damage was the City of Harvey, an industrial community 22 miles south of Chicago, where the total damage was expected to exceed the $2,000,000.00 damage from the 1947 flood.

M. G. Talcott

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

⦶	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield,
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NOVEMBER 1954
Volume LIX No. 11

ASHEVILLE: 1955

ILLINOIS - NOVEMBER 1954

WEATHER SUMMARY

November was mild with less than half the normal rainfall. The end of the month found field work practically complete with the farmers occupied principally with mending fences, maintaining machinery, and routine chores. The fall-sown grains had germinated and were up to good stands but needed rain. Pastures were furnishing twice as much feed as at the same time in 1953.

The cool spell that began on October 27th continued to November 5th. Warmer-than-normal weather prevailed for the next two weeks with temperatures the last eleven days of the month near seasonal. Most stations registered their coldest temperatures on the 2d or on the 30th. The extreme was 11° at Freeport on the 30th. The 13th and the 16th to 18th were especially warm. The highest temperature was 76° at Harrisburg on the 13th.

The month began with snow over the north and central and rain and snow mixed over the south. An extended spell of fair weather began on the 5th and lasted until the 17th. Any precipitation during this period was light and widely scattered. Showery weather prevailed from the 18th to the end of the month with occasional snow flurries from the 23d to the close.

Corn picking and soybean harvest progressed slowly at the first of the month because of wet ground. As the ground dried, the farmers got to the fields and by the 8th soybean harvest was 95% complete; corn picking was in full swing, and activity in plowing was increasing. Ninety-five percent of the corn was husked by the 15th and by the end of the month only a few scattered fields remained unpicked. Plowing, ahead of schedule at the middle of the month, was retarded during the third week as the soil became increasingly dry. Farmers turned to fence mending and machine maintenance. Precipitation during the last part of the month improved the pastures which were twice as productive as last year. Fall-sown grains germinated well and made good stands but more rains were needed over the south. With the field work mostly complete, farmers were occupied with routine chores.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Φ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

DECEMBER 1954

Volume LIX No. 12

ASHEVILLE: 1955

ILLINOIS - DECEMBER 1954

WEATHER SUMMARY

December was mild with precipitation averaging 27% above normal. The rains increased the sub-soil moisture but more was needed, especially in the south and central parts. Some plowing was being done at the beginning of the month but farm activity consisted mostly of routine chores and the maintenance and repair of equipment.

Temperatures during the first three weeks of December were near normal. A week of especially mild weather began on the 23d. The 30th was seasonal and a new warm spell began on the last day of the month. Monthly temperatures ranged from 25.5° at Stockton to 40.0° at Cairo. Temperatures averaged above normal at all stations. Departures of the mean monthly temperatures from normal ranged from +0.3° at Cairo and Golconda Dam to +4.4° at Rockford. The highest temperature was 67°, registered at Jerseyville on the 26th; the lowest was 2° at Morrison on the 31st.

Precipitation over the entire State averaged 2.74 inches or 0.59 inch above normal. In general, it was above normal over the area that lies north and west of Chicago and Springfield and over another area that lies south of Vandalia. Precipitation was below normal over the belt that lies between those areas. Monthly amounts averaged about two inches over the north and central parts and over five inches over the southern fourth of the State. The greatest monthly total was 7.78 inches at Brookport Dam. The least was 1.05 inches at Quincy. Precipitation occurred during several periods of the month. Generous rains furnished beneficial moisture to the south on the 5th; more rain over the south and snow over the north came on the 8th and 9th; the third period persisted from the 15th to 20th; the final period from the 26th to 30th. Amounts during this period ranged up to 4.14 inches which occurred at Du Quoin. Harrisburg reported no snow during the month. Dixon, Oregon and Rockford, at the other extreme, reported 17.5 inches.

Little field work was accomplished. A small amount of plowing was done early in the month. Farm activity during the rest of the month consisted mainly of odds and ends, repairing machinery and equipment, and routine chores. Crops were dormant or semi-dormant. More rains were needed for sub-soil storage.

Lucius W. Dye

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Additional information regarding the climate of Illinois may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, Capital Airport, Springfield, Illinois.

⦶	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

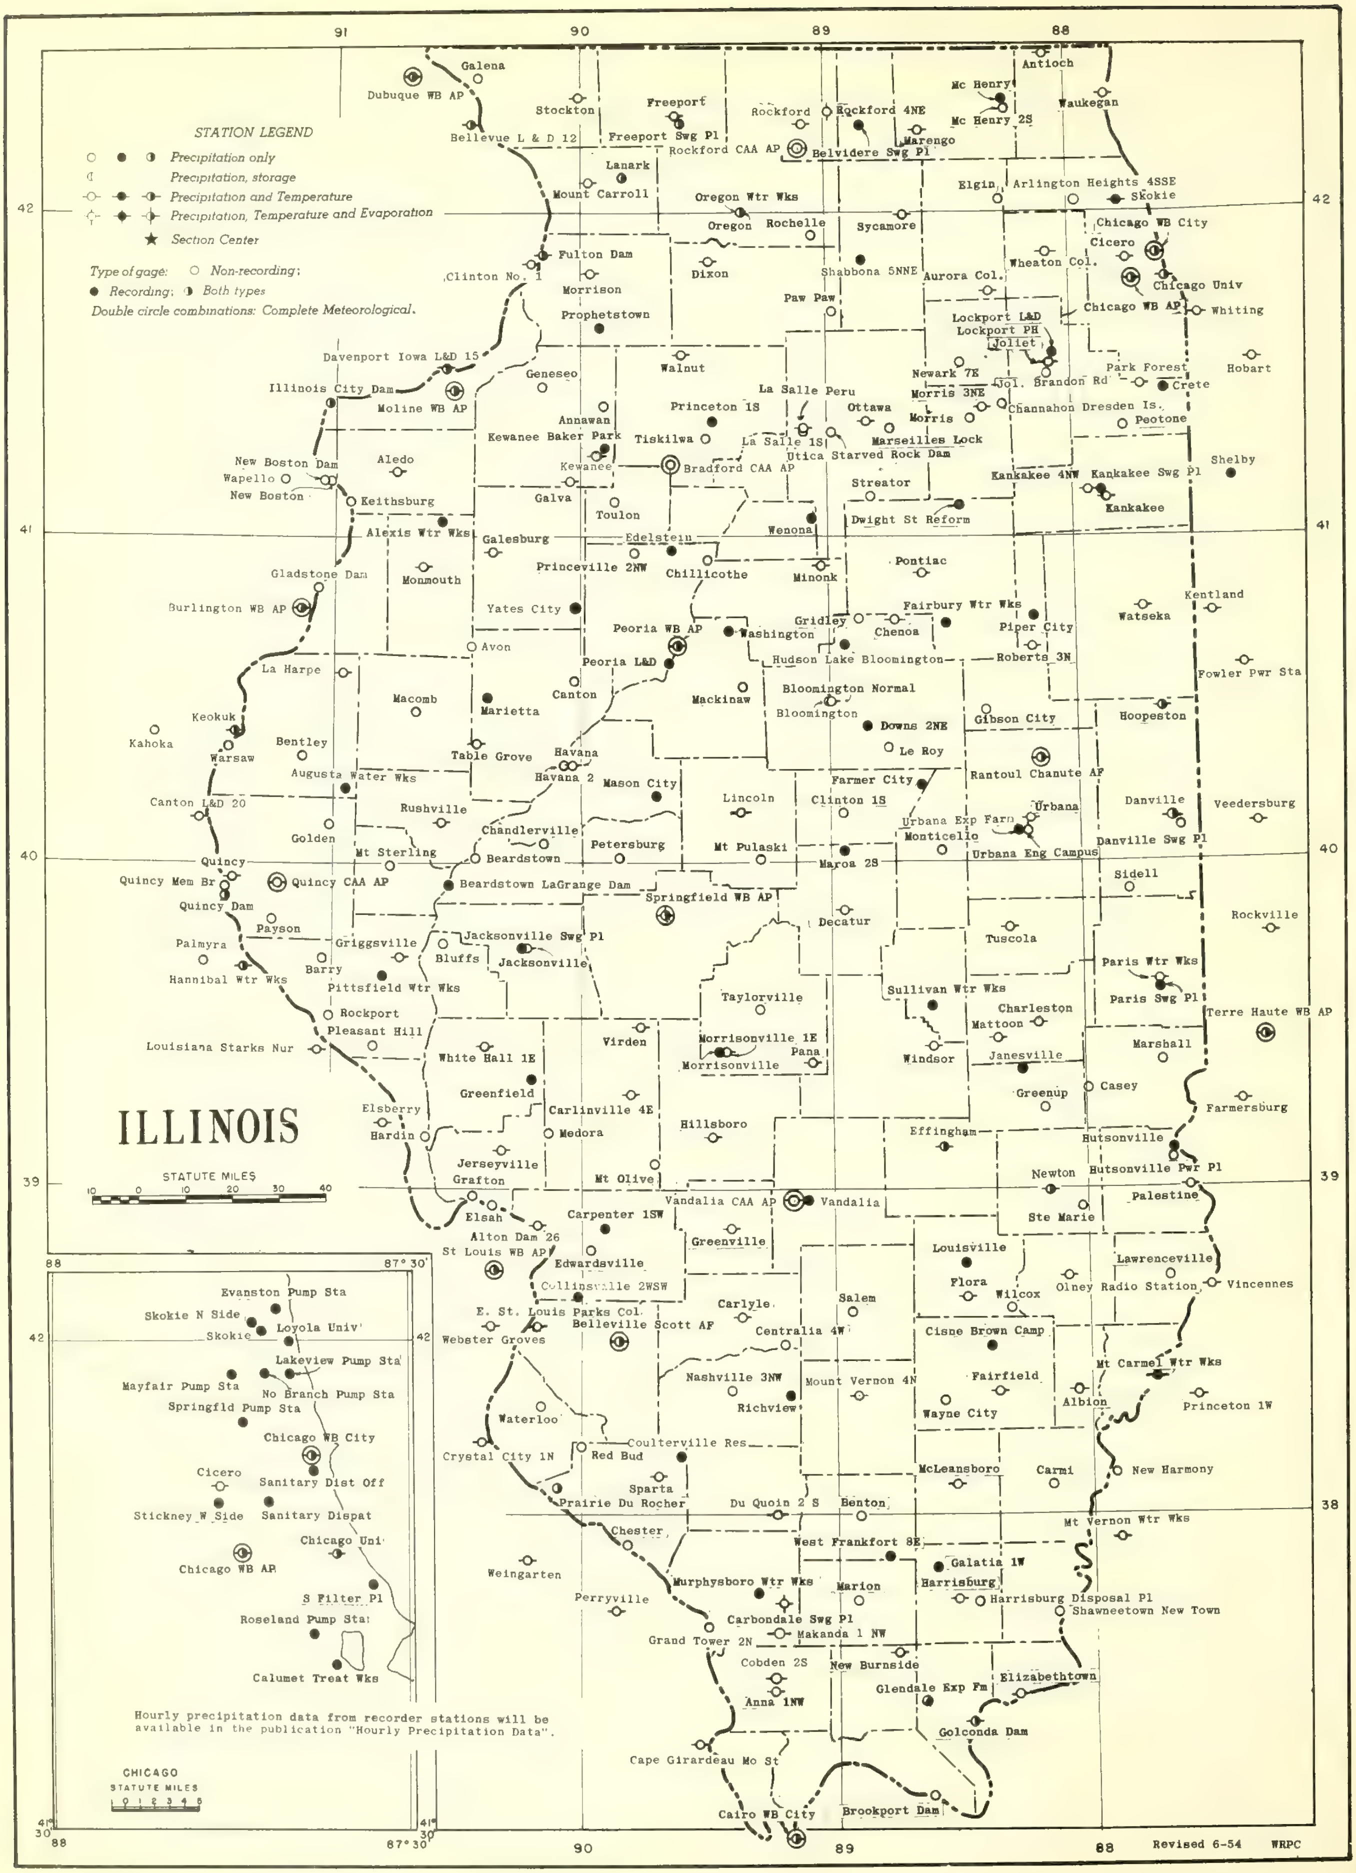
Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NWRC, Asheville, N. C. -- 2-14-55 -- 960

CORRECTIONS

July 1954: Mt. Carmel Water Works, Table 5, delete minimum temperature on the 30th.

October 1954: Weather Summary, first paragraph, fourth line, average precipitation should be 5.22 inches.



Hourly precipitation data from recorder stations will be available in the publication "Hourly Precipitation Data".

ANNUAL SUMMARY 1954
Volume LIX No. 13

ASHEVILLE: 1955

ILLINOIS - 1954

WEATHER SUMMARY

The State annual average temperature of 55.0 degrees was identical to that of 1953 and was 2.2 degrees above normal. Summer temperatures were the highest since August 1947 and a new record high of 117 degrees was established. The average annual precipitation of 35.53 was the greatest since 1951 and was 1.29 inches below normal. Outstanding in the year was the northern Illinois storm of October 9 to 11 resulting in the greatest flood in the history of Chicago.

January and February completed a ten-month period of above normal temperature averages for the State. Except for cooling periods in March and May when temperatures dropped 2.5 degrees and 3.7 degrees below normal, the entire year averaged above normal. June and July were extremely warm with June the sixth hottest in 65 years and July the hottest since 1936. A new record high was set for the State on July 14 when Parks Air College in East St. Louis recorded 117 degrees. Cairo Weather Bureau had the highest mean temperature for the year, 61.4 degrees. Lowest mean temperature was at Stockton with an average of 48.8 degrees. The lowest temperature of -15 degrees occurred on January 17 at Stockton.

A continuation of 1953 weather gave a dry January, February, and March with the first return to above normal precipitation in eight months when April averaged 4.15 inches which was .60 of an inch above normal. The next three months were below normal with harmful deficiencies concentrated in the central portions. This was especially true for the month of July. Drought conditions were checked in August when an average of 5.04 inches of rain fell, the greatest for any August in the last eight years. A return to subnormal rainfall the following month recorded the third driest September in the past 65 years. Again in contrast, and definitely terminating the season's drought, the month of October was extremely wet when the State averaged 5.22 inches which was the second wettest October in 65 years. November had less than half of normal and December 27 per cent above normal. The average annual precipitation was 35.53 inches. This was 1.29 inches below normal but was the greatest total since 1951. The greatest annual amount occurred at Cicero where a total of 48.59 inches was recorded. Least annual total was 22.62 inches at Grafton.

A Continuation into 1954 of the 1953 drought was one of the main factors affecting crops. Yields of corn, soybeans, and late grass crops were cut sharply by summer in southern Illinois. However, weather conditions were favorable in most areas until after small grain harvest. The planting of corn and soybeans was accomplished near optimum dates but both crops were hurt by soil moisture shortages which became more pronounced after late spring, affecting southern Illinois first and thence progressing northward as the season advanced. Failures and near failures of corn and disappointing soybean returns were common in many southern counties but yields were near average or above in most communities above mid state and record highs were reported in some of the northernmost areas. Severe deterioration of pastures occurred in all but the extreme north. The corn crop was smaller than average and the production of soybeans was Illinois' third largest. A reduced acreage produced a record high wheat yield and the oat crop was near average.

STORMS

Severe storms of the year began the first day of April when damaging windsqualls occurred in Macoupin and Coles Counties and locally northeastern Illinois. This was only the beginning of a series of windsqualls and severe windstorms frequently dominating the weather picture from April through August. There were 10 days in June and 10 days in July that had severe windstorms, hailstorms, or tornadoes somewhere in the State. August had three days of windsqualls and hailstorms. Tornadoes occurred on April 3 in Kankakee County with loss of one life and 13 injured, on May 27 at Aurora, and on May 28 near Eureka. A small tornado occurred in Fayette County on July 14 with one person injured. Considerable to extreme property damage accompanied all tornado occurrences. Hailstorms were frequent in June, July, and August with general hail damage during August. Outstanding of the year's storms was the severe storm and deluge over northern Illinois on October 9-11 which resulted in the greatest flood disaster in the history of Chicago and nearby communities to the south and west.

Marion G. Talcott

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

Additional information regarding the climate of Illinois may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Airport Station, Capital Airport, Springfield, Illinois.

-	No record.
+	Also later date (dates) or months.
*	Amount included in following measurement.
//	Gage is equipped with a windshield.
B	Adjusted to full month.
E	Amount is wholly or partially estimated.
M	Less than a complete month of record available; if average value is entered, less than 10 days of record are missing; see monthly Climatological Data for detailed daily record.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.

Subscription Price: 20 cents per copy; monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.
